One tip, get the NEW version. The IC-706MkII. I just got one last week and so far I like it. Go to Icom's web site to learn more about it. It's an HF/6m/2m radio. 100watts on HF & 6 and 20 watts on 2 meters. Separate coax connections for HF/6 and 2 meters. FULL of neat features too.

73,
Tom

Do you want to learn unix, but are reluctant to install Linux on your PC? Consider a ProShell account at JTAN instead.

Why struggle to install Linux on your PC when you can have a completely pre-configured unix shell account on a dedicated 24 hour internet host with a high speed dedicated connection. Make your first experience with unix fun and educational rather than a battle.

The JTAN ProShell (TM) account puts the power of a full privelidged unix shell account at your disposal. Most of our ProShell users choose accounts hosted on multiple Sun Sparc computers running the Solaris Operating System (2.4 AND 2.5.1), an advanced form of Unix System V Release 4. We also have Linux machines for users that prefer that environment and FreeBSD machines are on the way.

The ProShell Account is an excellent companion to a bargain PPP account. It adds back all the features that are typically left out or watered down by most ISPs. Our shell, web server, email, and system features are second to none.

Shell Features

* Unlimited email tech support to answer your Unix questions
* Complete complement of prebuilt Solaris and Gnu software
for email, news, C/C++, Internet, IRC, and lots more...
* Cron and Background Processing allowed
* Incoming FTP or Map your directory as a Windows Network drive
(SAMBA)
* Mathematica command line

Web Server Features

* Personal Web page with CGI and SSI
* Automated Personal Web Statistics
* No fixed disk space limit

Email and News Features

* 24 hour receive Fax service
* PGP mail and PGP Key signing
* Anti-spam filtering (splam, Sendmail 8.8.7)
* Mail forwarding and auto processing (procmail)
* Free mail aliases and mailing list hosting
* Local high speed news server and ultra-fast nn and tin clients

System Features

* Lightly loaded T1 bandwidth to first tier provider
* Reliable Sun and Cisco hardware
* UPS Power and tape backup (your files are safe)

!!!!! A full year of ProShell access is only $99 !!!!!

For more information on JTAN ProShell account membership, terms, and
FAQ answers, browse

I built several of those George. Each one worked quite well. As a
matter of fact I have one out in the garage that I had on my old VW
bus! (Yep good ole "bong technology" :>) It managed to increase
mileage by a few percent and definitely helped "ping". I have spoken
to some of my hippie friends and they believe (in between bongs hits)
that it "cools the charge" and allows the gas to burn slower. Does
that make sense? Seems that if the humidity is higher gasoline burns
better. Since I live here in Oregon, low humidity is not a problem.

Exactly. The result of "Incentive licensing" was the loss of most of
the manufacturers of amateur radio equipment. As a result, from the
equipment we can still get, you cannot buy a radio that can do 9600bps
without opening the case and modifying the unit. This voids the
warranty and reduces the resale value of the rig.

But since the current license requirements pay more attention to
outmoded and antique modes of communications, instead of technical
competence, most hams are more familiar with tape recorders or
computers running Super Morse than they are with soldering irons,
making it even less likely that they will be able to use any of the
more modern digital modes.

Maybe the demise of the TCM3105 is the perfect excuse to
rethink packet, take advantage of new technology, and come
up with a new system.

Surely we can do better than Bell 202 1200 baud AFSK?

The "nobody to talk to" excuse is getting old. All it means
is you must be prepared to work collaboratively with others.
Like the original packet folks did.

It took this long for anyone to complain. It will not do any good. But I guess you are lucky, its beginning to putter out anyway.

Plus, one of my posts had a question on part 15 SS radio modems, no one chose to answer it. Everyone found that the "other" discussion had become much more interesting.

Have a nice day,

MX-COM has a bell 202 modem chip called the MX614. Check out their web
page:

http://www.mxcom.com

I bought 4 of them recently to experiment with but have not had time
yet. They were priced at less than 5$ can.

BTW Bell 202 standard still has at least one commercial use. As I
understand, it is the standard used for "Caller ID" on phone systems.

Here's the rules: The PMS can only take one station at a time. You have to wait until you see a station disconnect before you try to connect. If you try and then see another station get in you should stop your trying. It is NOT easy to get into the PMS. The PMS callsign is R0MIR-1. The keyboard is R0MIR and it too is now HARD to connect to. They USED to allow 7 keyboard connects at a time but now it's only one. All I can say is keep trying but do it the right way. There are several what I call "Mir hogs" that you'll see on almost every pass, they do NOT make it easy for us to get a chance. You'll know who they are if you don't already.

Good luck and keep trying!

I don't know anything about GEET or their
process. In fact, I have never hear the term before.

But, I asked my father about this. He says that
water injection was used in aircraft engines
during World War II to increase effective
power output. He says you can find lots of
old (1930s) articles on water injection
in the Journal of the Society of Automotive Engineers.

Apparently it works by increasing cyclinder
pressures near the bottom of the stroke.

Of course, there is no energy coming from the
water, and the water is not burning, and there
is no violation of the law of conservation of
energy.

In a water injected engine there is less energy
in the exhaust gases, all other things being
equal. The water is merely a means of
extracting a little more useful energy from
combustion gases.

My Dad says further, that water injection
shortens engine life and for ordinary applications
(other than racing or warfare) it is not worth
the trouble. Of course, it is quite possible
that technical advances in the last 50 years
have solved the drawbacks of water
injection.

Exactly right, Laura. I'm glad someone got my point.
If we can get people to stop thinking of packet as an
accessory for their voice grade FM radios, and start
thinking digital radios, we can start to make some
progress again. But people must collaborate. A
switch to a better method can't occur in a vacuum.
Packet is a team effort.

Look in the Appendix of the manual. There's a hookup and procedures for using them over radio. Operated at 300 baud, they are compatible with current HF amateur packet modems (Bell 103), but of course you'll need a PAD too. Operated at 1200 baud, they aren't compatible with Bell 202, they're Bell 212, but they can be used half duplex over ordinary FM radios for dedicated point to point links. We were using the original Smartmodems over radio before packet came along.

It isn't really practical to use these things today, but you *can* if you want to. Dale made sure that they'd work half duplex over radio. Newer telco modems won't work. They have to train on a duplex channel. But these old things will work just fine.

AGREED !
However, if the math that is in the new model wasn't in the previous model,
then while the older examples fit the new model, the newer examples may
not fit the old one. In either case, the modelers may no know what questions
to ask the lightspeed computer.

Philoprogentivinisticism may cause the doting mother to ignore her baby's
faults, but the world at large will not do so.

However, the world at large will quite readily throw out the bby with the bath
water.

I looked at the GEET (www.geet.com) page, and I noticed there wasn't any
way to check the "letters of recommendation" until I came to NASA.
I still haven't found an E-mail for NASA, but I got their snailmail address.

I will, if I don't forget, write them and ask if they can find a copy of a
letter written from the source in the page.

Look it up and try it yourself.

There is the essence of avoiding naysaying: Individual, independent investigation to find the truth.

Good luck

I remember my roomate building one from a Mother Earth News article in the
`70's on water injectors to help supress detonation in high-compression
engines using crappy gas. It worked pretty well. It was basic bong tech
(and thus within the range of the average MEN reader's capabilities! (-:)
It basically guffed a little water vapor from a resivoir into a vaccuum
hose. Made my roomate's Belvedere quit dieseling, I must say.

```
Archive-name: radio/personal-intro
Revision: 2.2 98/14/05 03:50:23
Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul
Schleck, K3FU, pschlect@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
newsgroups is so that folks who aren't interested in, say, homebrewing,
don't have to wade through messages about homebrewing on the way to read
about Field Day. Posting appropriately is just good etiquette.
```

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserve.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Here are several reasons why you might want a ProShell account rather
installing Linux on your PC:

1. If you want your linux box connected directly to a T1.

2. If you want someone else to deal with administratrivia.

3. If you don't already know unix and want friendly tech support.

4. If you want access to a local news machine but can't afford 20 Gigs of
disk space.

5. If you want a fax receive service

For more reasons, see

http://www.jtan.com/proshell/reasons.html

Duuuuuude, like, their logic was, like, flawless and.... Uh.... Heh heh.
Got any triscuits?

Actually I am pretty sure that the water vapor introduced to the mix had
very little to do with cooling the charge. Some sort of heat exchanger
would be needed to get any kind of useful cooling. What the water does in
the "bongload depingifyer" is to prevent _detonation_. The agua will
indeed slow the burn and prevent power-robbing explosions (ping). A
smooth burn is a good burn when pushing a piston.

I am pretty sure that the army used this method during "the big one" to
allow use of less-than-great gas in airplane engines.

Sure is easier for me to get my head around a water injector than a
computer-controlled ingition! (`course now that the auto guys have the
bugs worked out of them they are prolly less trouble than keeping a
little water tank filled!)

> that make sense? Seems that if the humidity is higher gasoline burns
> better. Since I live here in Oregon, low humidity is not a problem.
>

I'm sure there is a point of diminishing returns. Maybe we should ask
someone with a hot-shit ski boat about their experiences! I'll bet a
600hp Big-Block Chevy would inhale a few gallons on the back of a boat.

I disagree with administrative reason....

What good is learning unix if you can't administer it? For learning C, PERL
or such
yes..But a lot of unix stuff requires administrative rights. Granted it's
might be
tough trying to keep LINUX & DOS separate, (Like when you leave Linux up
and your 4 year old resets the computer so he can play his computer game!)
But in general, it's not too tough.

George Gallen
ggallen@slackinc.com

PS
What good is a T1 connection if you only have 14.4 or higher connection to
it?
Doesn't that drop the T1 speed down to your connection speed?

: Here are several reasons why you might want a ProShell account rather
: installing Linux on your PC:
:
: 1. If you want your linux box connected directly to a T1.

Then it wouldn't be "my linux box" and I'd still have to dial-up. :(
I run linux on a cable modem now. It kicks ass. I'll never go back to
MS-Sucks.

: 2. If you want someone else to deal with administratrivia.

Personally, that's the fun part. Hell, everyone in my family, even my
friends, have an email address that starts with their first names! ;)

: 3. If you don't already know unix and want friendly tech support.

Ruins the fun...

: 4. If you want access to a local news machine but can't afford 20 Gigs of
: disk space.

You can do this with any type system.

: 5. If you want a fax receive service

See answer to above.

: For more reasons, see
: http://www.jtan.com/proshell/reasons.html

And waste more of my time? ;)

>> > called)degree.

>I use to when I took pride in HAM radio but it has degraded into
>something that makes me stay off the air most of the time.

Good grief, people! If you don't take pride in your license, DON'T GET IT FRAMED! But don't bitch at the poor people offering the framing service!

I've been a ham for over 35 years and on the Internet for almost 20, and I don't equate the bottom feeders on the newsgroups with Ham radio any more than I do the profane jerks on 75 meters.

Ham radio is what YOU make of it. If you don't like Ham radio, go away, but don't rag on those of us who still enjoy and take pride in it.

There are indeed a few groups using higher speeds on amateur packet as
we are here in northern California. However, as Gary has already noted,
it is far from the norm.

Although it seems to be commonmly hailed as the cause, I don't believe
that the fundamental problem is the lack of higher speed radio and
digital hardware, even though each has extremely low representation in
the amateur marketplace.

It's my belief that even given totally *free* hardware, that it is
unlikely that amateurs would be able to develop a network which is truly
'competetive'. I think that the reason for this are more physical than
social and probably more social than economical.

If you are interested in more details, please see my pages:

http://www.tapr.org/~n6gn

or

You don't get any energy from the water. The water is used to slow the combustion speed to allow for extra advance in the ignition timing without causing pre-ignition (i.e. knocking) or to kill knocking when lesser quality fuel is used. Water is also used in jet engines to increase the mass of the thrust air after the combustion chamber, mostly limited to take-offs and landings due to the extra weight.

1400. 1998 PacketBASH at Dayton Hamvention!

```
-----------------------
Dayton Activities

Attending the 1998 Dayton Hamvention? Then don't miss out on PACK*BASH!

What?
An event for the digitally-inclined ham, featuring:
* Buffet dinner
* Keynote address by Tom Clark, W3IWI
* TAPR special interest group meetings
* "Birds of a Feather" gatherings

When?
Friday evening, May 15, 1998
Doors open at 7:00 pm; dinner served at 7:30 pm
Speaker and meetings after dinner

Where?
NCR "Sugarcamp" Conference Center, 101 W. Schantz Ave. --
South of downtown Dayton, just west of Main St. (Rt 48).
Maps available on the TAPR web site (www.tapr.org) or at the
TAPR booth.

How?
Dinner requires advance registration and payment through TAPR.
Tickets will be available at the TAPR booth on Friday, though
we strongly encourage registration <before> Hamvention. The cost
is $20.00 per person, tax and tip included.

All amateurs are welcome to attend, enjoy the speaker, and
particpate in the meetings, although only those purchasing a dinner
can eat.

To register, contact:
PACK*BASH
c/o TAPR
8987-309 E. Tanque Verde Road #337
Tucson, AZ 85749-9399

Phone: (940) 383-0000
Fax: (940) 566-2544
Internet: tapr@tapr.org

Visa/Mastercard Accepted
```

Who?
PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio,
the national leader in digital communication -- and the Miami
Valley FM Association, Dayton's packet radio club.

For more information (including maps), go to
http://www.tapr.org/tapr/html/dayton.html, or send email to tapr@tapr.org.
You can request information via packet radio at BASH@N8ACV.#DAY.OH.USA.NOAM.

1402. Emergency Alerting System mystery

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-16 00:00:00 UTC
From: johng@comm.mot.com
Message-ID: <johng-ya02408000R1603981322230001@news.cig.mot.com>
Source record: 24885
Cross-posted to: comp.dcom.telecom.tech,rec.radio.scanner,rec.radio.amateur.digital.misc

The "Emergency Alerting System" is the replacement for the Emergency Broadcast System. This system is used by federal, state or local authorities to alert the public to severe weather, disasters, etc. A compatible system is also used by the Nation Weather Service to provide selective digital alerting via their 162 MHz VHF "weather radio" transmitters.

The technical standards for this service are provided in Part 11 of the FCC rules. The standards mandate a data signal at 520.83 bps using 2083.3 Hz mark and 1562.5 Hz space frequencies for the audio frequency shift keyed signal.

My question: Does anybody have any idea of the reason for using such an unusual data rate and choice of mark and space frequencies?

If you take the frequencies and scale to a 600 bps data rate you end up with 2400 Hz mark and 1800 Hz space. I suspected that this coincided with a standard CCITT or Bell data standard, but this doesn't appear to be the case. If this had matched an industry standard, this would have allowed a designer to use a standard modem chip set with a different clock freq. Keeping the data rate non-standard would have added a minor element of security to the system.

There must be some reason for such a bizarre choice on the part of the system designers. Can anyone shed any light on how this data rate and mark/space frequencies were picked?

Ok Lou-
Tell me what does water injection into engines to help retard pre-ignition have to do with packet, pactor, clover or anything else dealing with the digital modes on the ham bands. Nothing at all, but maybe "packet" is dead when this newsgroup needs to stray from the topic. Now, I'm not bashing the subject of the thread just the fact that it's not appropriate for this newsgroup. Than again, I suppose someone could talk about sex on this newsgroup if they "did it" while on packet radio.

As I have been given to understand from a radio person I know these rates are
nonstamdard so as to descourage disruption and abuse of the service by
Hackers, of course that wont stop enterprising individuals.

>: limited.

People tend to do what they really want to do. High-speed packet has been around for quite a while, and after all this time, only a small number of hams bother with it.

There are a number of reasons. It's a lot more expense and trouble, and less "robust" than 1.2kb stuff.. Not all hams are interested in additional expense and trouble, or reduced reliability from fussy equipment. Most of them would rather use something easily available, inexpensive and tough enough to operate in less than ideal conditions. They'd like to just buy the equipment, take it home, hook it up and go. No geeky "experts" required please!

Networkers are interested in high-speed, but again that is only a small percentage of the packet population.

Another reason: Higher frequency radios tend to be more expensive and harder to find than a good old-fashioned 2-meter mobile rig.

On the bright side, 440 Mhz radios are coming down in price and more models are now available than in the past.

There's nothing wrong with high-speed packet, but don't frustrate yourself imagining that "everybody" will soon be using it. It's an interesting and challenging part of amateur packet radio, but it's not for everybody. In fact, it appears to be something for very few indeed.

Why? that's about as pointless as framing an associates (so
called)degree. Sure the lic lasts ten years nowdays but it and
$20.00 won't even buy you a decent meal. A "HAM" license is like
a drivers license. You wanta use the privledge you take the test.
And give some tight assed "I'm important" VE your money. Woop te do.
Oh yes I'm a "HAM".

1410. 911.25 MHz: What license

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-16 00:00:00 UTC
From: dgoncz@aol.com
Message-ID: <19980316030001.WAA02835@ladder03.news.aol.com>
Source record: 25014

What license is required to brodcast NTSC video and audio on 911.25 MHz?

I can receive it with a 400 MHz downconverter to TV channel 21.875 (almost 22).
I'd like to buy the downconverter first, it's cheap.

What can I expect to monitor without license in the 800-900 MHz? Will I be
stepping on anyone's toes when I broadcast? How accurate is a downconverter?
Could I tweak something in a transmitter or downconverter to make this work?

I am looking mostly at Ramsey for the downconverter and transmitter. My PC TV
receiver doesn't receive cable channels, but 14-69 are fine. I am looking at
some more RAM to get full screen video with or without sound. My current
reception is 160x120 pixels, 32768 colors, 8KHz mono 8 bit audio, for 6 seconds
at 5 fps with continuous audio, with 100% success.

I'd also like to get a directional UHF loop hooked up. I've played with one
using a balun. Could I do any kind of navigation with a UHF loop and a compass?

Am I off topic? It's digital, it's radio, and I'm an amateur, but it ain't
packet!

Yours,

DGoncz@aol.com

My patent attorney won't work on ideas I discuss on the Internet.

1412. feasibility question from prospective newbies

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-16 00:00:00 UTC
From: drepasky@kiva.net
Message-ID: <RE4P.697$xD2.3536852@news.inreach.com>
Source record: 25016

This question is from complete outsiders who wonder whether a mobile packet rado station is for them. Is it feasible to set up a mobile packet radio station in such a way that "travellers" could check/send internet e-mail from where they happen to be? The question has 3 parts:

1) Is it possible to gather suitable hardware on a limited budget? The mobile unit is a volks van with 12 v power supply (solar panel charging deep cycle marine battery). The computer a 386 lap top. Completely up in the air is a transceiver and TNC. I don't know exactly what kind of budget we're talking about, but I do know that cash is in short supply.
2) How likely is it that travellers will be able to locate access to the net? The travellers are Canadian, and they will travel mostly in the SW United States (Utah, Calif, Ariz are desirable) and in Mexico (possible endpoints: Chiapas, Oaxaca, Campeche).
3) What kind of licensing arrangements are there between Canada and Mexico? We understand that Canada and the U.S. honor each other's licenses.

Thanks,

Dick

1415. Is there anyone out there using a Tandy M-100 for packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-16 00:00:00 UTC
From: Timothy Vermette <tvermette@inet2000.com>

Source record: 25019

Do you use a tandy model-100 for packet? How do you find it? Any good programs for it? Just about to buy one would like to hear from other that use it for packet.

I use to when I took pride in HAM radio but it has degraded into
something that makes me stay off the air most of the time. It's as
bad as the news groups. When I frist got my Novice lic. back in th '50s
and ran CW I was very proud. Then I upgraded and got into AM things
were perty good during the '60s. Then every thing went SSB and power.
and the tech talk (just like someone advertizing plaques on these news
groups)went to hell. I guess it's because I'm a builder. and I meet so
many "?HAMs?" who don't know any thing except how to turn on a store
bought rig that makes me so jaded. I was actually tring to flame someone
who advertizes on a fairly good bunch of news groups. Hell if I wanted
to make a plaque out of my Amateur license I would decopage it on a
peice of nice looking finely sanded wood coated with urathane. I would
neve pay some one to do it for me. course that's me and i'm a builder
and experimenter. Not a switch flipper.

It doesn't have 80 column display. Its so slow it loses characters
at 1200baud (or is 2400 baud?). Little to nothing to allow
you to run in KISS mode.

Your much better off buying a Toshiba T1000 with 640K and DOS.
You can pick these things up for around $100.

More over, why pay the phone bill, deal with someone else's
security policies, have a disk quota, forgo root access and the
ability to install your own software/configuration, etc.?

Linux is trivial to install compared to things like Microsoft
Windows, and you'll learn considerably more doing it yourself.
It will also be considerably cheaper for most people.

I have a feeling Gary Coffman will nail me for saying this but... Spread spectrum has been "just around the corner" for a couple of years now. It always looks like in a couple of months there will be a modem released. There hasn't been yet... There are a few people running modems, that could be made into kits, but the effort invloved with that is MANY times greater (in most cases) then designing the darn box~!

I wish I had the electronics knowledge to contribute towards the spread spectrum efforts, but I still learning. Current project right now is to build a 9600 baud, full-duplex, bit-regenerating repeater. As usual I'm having much more problems trying to get a frequency then I'am building the darn thing!

ROTFLOL!!!! (rolling on the floor laughing out loud!)

Because we are lazy. There are very few people that are willing to
activly
build and upgrade packet networks. In my area there is only four people
(self
included) that work on the network, and 45 people that use it. Those
numbers
become worse in large areas. Pretty soon everyone is frusturated with
the
network and it dies off.

If you are interested in 19200 and up you should find a few people in
your
area with similar intrests and make it happen. You might lack the
knowledge
and experience required, but your enthuasiasm (sp?) will make up for it.
Hopefully.

Couple years? Yeah, still for people working on a part time project,
I don't see 2 years as necessarily too out of line
for getting a board like that finished. Especially if they have
to build the hardware and then ALSO develop complicated software for
it. Software that can't be tested until the hardware is done. I figure
we call it loss around 5 years or so. Still, realistically, if it doesn't
look like a SS modem won't be around for another couple years,
then maybe 56Kb makes sense.

The paccomm.com site lists a wa4dsy for $349.00. Is this thing shipping? If
I believe the brocures it looks like all the parts are available
off the shelf for 56K. Aside from the slightly high, though reasonable
considering the numbers they probably do on this kind of thing, price, am
I missing something?

I'm afraid ham radio bands have one dead repeater every 15Khz, with a guy
sitting by the radio, waiting to tell anyone who tries talking, "This
is a closed repeater." Could you put it on 219Mhz? What's the deal
on that?

I believe I've seen an article in either 73 Mag or QST that modified
one -- that would take some finding here. What I did here some years ago
was to use the AM9711 chip from one to make a Baycom modem, this worked
fine. I can't remember where I got the circuit, but I found it on the
net somewhere (I think in an article posted here) just as I had finished
designing one which was pretty close to the published one, I used to
have the circuit till I had disk troubles, but I suspect it's on one or
more floppies somewhere around my shack, if I find it, I'll send it on,
it's in postscript format.

Jim,

I've been using FlexNet's package for some simple DX spotting. It appears to work well once it is initialized. It will occasionally require multiple restarts before it gets going. This I attribute to my slow computer, an old 486-33. I am running windows 95. FlexNet only needs a Soundblaster or compatible card running on a PC (it might support a Mac, but I had no interest and do not remember).

FlexNet will support either a DOS environment or a Windows 95 environment. I've gotten both to work. The main hassle was the cabling, but you've got that complexity with anything.

If you're interested in it, read ALL the instructions. Each hypertext link points to a small pot of gold. It's an exercise to the student (us) to integrate it and apply it to our specific system circumstances. The documentation is quite complete and very thorough. I recommend it to you. Make sure you read the doctn having to do with the FlexNet system, as it really does a good job relating all the parts so you know how the pieces fit with each other. Several option combinations and plug-in choices exist.

See URL: http://dl0td.afthd.th-darmstadt.de/~flexnet/

Good luck and 73,

Gary W2CS

GPS is probably the method of choice. In many areas, WWVB coverage
is not continuous, though I must say I was surprised when I installed a
WWVB synchronized clock recently and it managed to acquire and sync
in the daytime here in the Southeast. (Oregon Scientific clock sold by
Tech America.) But you have to do your own offset calculations when
using WWVB.

Tom Clark's TAC (Totally Accurate Clock), available from TAPR, is probably
the simplest way to get atomic referenced time sync on a 24x7 basis. It
works with a Motorola Oncore GPS receiver module (also available through
TAPR). But most GPS receivers have a 1 PPS signal that can be tapped
if you're willing to open them up and probe around for it. The $99 Delorme
unit is a good hacker candidate.

For synchronization of HF digital signals, atomic time is probably more
precise than you need. A convenient common reference could be TV
sync from one of the GEO TV sats. As long as everyone involved uses
the same signal, they should be locked together with sufficient precision
for HF data rates. You still have to do HF path delay compensation anyway,
so all you care about is a common reference, and not a particular absolute
time reference.

Thanks Gary, I have a GPS38 with a serial port but the case is nitrogen filled/sealed. What I would like to demonstrate is solid CCW communications based on signals that humans cannot hear through the noise using only a transceiver and a PC equipped with a sound card. I figure a 1 PPS GPS signal and 100mS/dit ought to do it. Has anybody else tried/done such a thing? Anybody want to try it? My ARRL Handbook says that CCW has about a 20dB advantage over CW and I would like to demonstrate that fact to some guys over on r.r.a.policy who just don't believe it.

Compared to 100mS/dit CCW, how does a 10x10mS Goertzel sampling window compare for asynchronous CW? Machine generated vs human generated? In other words, if the CW wpm is machine generated and known, what dB advantage is that for asynchronous CW?

well, given the difficulty of doing something that's unavailable "off-the-shelf" i'll probably take a lot longer getting something started, but i most definately will eventually get some sort of system in place. wouldn't it be nice if we could somehow tempt hams into upgrading their systems? if a well connected cross-country network sprung up which could be connected to at a mere 1200Kb/s but could also be connected to at much higher rates (presumably with content to warrant it), don't you think that people would be more interested in upgrading? right now i could build a system to go as fast as i wanted but what good would it do me? - i have nobody to connect to. We need to come up with an excuse to use Megabit+ microwave links. The web et al is the motivation for non-hams to buy pricey phone lines and modems.

So what? Water injection does this already. Are you saying I should by a expensive GEET fuel processor instead. I want neither. As sensors, fuel vaporization at injector, and software improve machine control systems, 99% of what is now achievable by a troublesome water injection system will be attainable. I'm not going to coninuously add water to my engine's fuel system, nor will I mix special fuels for the GEET. Noticeable decreases in emissions and small increases in performance are not what I would call "ground breaking technology" as its played up in the GEET pages. BTW, I have visited every single page you have posted here, but each one has the tale-tale sign of uninformed writers who are soon to be hit for a buck for absolutely no return.

Granted I may still want a water injection system on a prop plane. No matter how reliable an electronic IC may be, they don't hold up well to atmospheric lightening, unless you are the military and can afford the necessary protection.

Not really, this whole thread is a rehash of what others and I have said about water injection. MHD is the moving via application of magnetic fields, or the generation of power by applying a magnetic field to a high energy plasma, of which car exhaust doesn't really apply to. I would doubt MHD would have little bearing on a combustion engine.

Ya'll can spawn as many threads about ICE's in a radio group as you like, but even one of the prime supporters has admitted that GEET is nothing more than a glorified water injection system with only small gains in gas mileage and emissions, both the exact same effects as water injection. Face it people, its not anything special. But you can have your fun I guess, it is a free country after all.

You know, it's all coming back to me now- this is the CORRECT reason
for using water injection- it eliminates detonation and ping.

Thanks for the history lesson! And yes, with it, you can burn a lower
octane of gasoline. The slower the gas burns, the less pinging. And-
some people are not aware of it, but the higher the octane of gas, the
slower it burns.

Where are you located, btw? Sounds like you need at least one other
friend into this stuff. I assume that the early adaptors in anything
probably are going to have to setup up some kind of backbone for the
system to be interesting. What can you do with a network? Maybe connect
a few 160M receivers with rhombics out in the sticks somewhere. With enough
bandwith, you could digitize the whole band. I don't know,
it's all madness at some level or another. At some point, I think I just
become comfortable that the need is simply to accumulate more electronics,
and not to fuss about the practicality of it all. Imo, high bandwidth
has applications that the guys building the network can't imagine.

So maybe it isn't so much setting up my own system, but finding hilltop
digital repeater sites and all that. I've never been involved with building
repeaters, myself, so I don't really know who you have to schmooze up
to make this happen. Especially on the issues of like finding a site and
getting power for it.

Also, are any hams actually doing high speed spread spectrum stuff right
now? Is this really how it 'should be done'? Is it worth playing with 56Kb
stuff if better spread spectrum equipment is just around the corner?

Just how do you think hydrogen comes about? By alot more energy than you get by burning it with oxygen, thats for sure. Its the common rule of effeciency, and this process happens to be on the best examples. However, we do have plenty of sunlight with which to separate water into its constituent parts, so I would still deem it a viable technology, that is to burn hydrogen (not water, Phil, but hydrogen, I hope you realize they are different) extracted from water at huge solar stations.

It has QUITE A BIT!!!!! You mist it to reduce the surface area of the droplets allowing the water to heat and vaporize quickly. The reduces Charge Air Temperature, by vaporization of said water, which reduces temprature, which reduces detonation. Detonation is when the flame front doesn't start at the plug, but at the cylinder walls, because the mixture is so hot, all it needs is that extra juice available from the cylinder walls to trigger off center flame fronts early on before the plug EVER fires.

So yes, it prevents detonation, but BY COOLING THE CHARGE!!! Nothing less .... its an equivalent to the intercooler used on turbosystems. Heck you could replace the intercooler on a turbo system, but you don't have to fill up a turbo's intercooler with water over and over. If you want the proof in the pudding, write Lotus. They built the most powerful 4 cylinder production car ever made. It took the intercooler a step further with water, but removed the water from the air system and recirculated it instead of air to cool the charge air. The result? 285HP was the last remembered specific output for the engine as I can recall, all from 2.2Ls. What more do you need?

And when you run with less detonation in a engine, that means you can push the timing agressively up towards TDC, making more use of the resulting explosion. Get a basic mechanics text book on engine folks, all this has been written and rehashed millions of times, literally.

At first I didn't mind these threads, but it looks like 80% of the participants wouldn't know a engine from a electric motor.

I had the 9.6kb stuff hooked up and available (off and on) for over three years. Zero connections. No requests for info, nothing.

As for content, we can only hope that the quality of what we see will go up as the quantity does, against all available evidence. My guess is that we'll see a drop in quality as the quantity goes up, just as it did when @WW became popular.

I think packet and HTML are a natural combo. That's our best hope to see the quality go up a bit.

>We
>need to come up with an excuse to use Megabit+ microwave links. The web et
al

Packet networkers are a hard-headed, opinionated bunch, but even so, many of them are beginning to realize that the existing point-to-point networking system, even at Megabit+ speeds, is not going to handle our needs, except on a local basis.

Speed is a relative term, though.... If by "speed" you mean " How fast can this info be made available to all packet ops across a large chunk of real estate?", instead of "What baud rate is this info being transmitted at?", then you may be interested in Multicast. When used to cover large areas, a 1.2kb Multicast network will consistently outperform even a 19.2kb (or faster) point-to-point network, and it will do so with considerably less expense and difficulty. It's a heck of a lot more reliable, too.

Radio is a natural for Multicast. Point-to-point networks (even Internet) just can't match it's flabbergasting efficiency.

To utilize Multicast, you need a radio, a TNC2 (clone), a Win95 computer and Wa0PTV's Ham-Web software. The software comes in two types; Server and Client.
The Server program is for the Multicast transmitter. (Make sure your radio can handle 100% duty cycle, as it will transmit continuously.)
The Client software is distributed to hams who wish to receive the Multicast transmissions.

If you would like more info on Multicast, including info to back up my claims of higher "speed", check out the article on Multicast at my web site http://www.texoma.net/~n5pvl , and follow the link at the end of the article to check out the software for yourself. The docs for WA0PTV's Ham-Web software are excellent, and well worth reading.

Suggestion: The Ham-Web programs were intended for use on VHF/UHF networks, but 1.2kb is legal on 10 meters, and it looks to me as if the program can me made to work at 300 baud as well.

Want "high speed" at low cost with no degree required to get set up and going? Multicast is your best bet.

Go for it.

Bert,

I've used water injection quite a bit over the past 15 years and have no
complaints. If the engine is optimized to use the extra "octane" equivelance
you can see substantial gains. I've seen no problems with engine life. In
fact is seems much cleaner inside. No carbon buildup etc.

One should understand that there are many different configurations of water injection. The simplest just draw vapor under vac from a canister.
The best I've seen is the Goodman system. He actually made it on television and in a few magazines several years ago. He modified his car with pistons that raised his compression ratio to about 13:1, and with only the pistons and his water injection increased mileage by 50%. His system used the air pump to draw the water and provided a very nice "fog" that was proportional to load of the engine, something no other unit I've seen does.

Also, of possible interest:
Have you seen anything on Rudolph Gunnermans A-21 fuel?
It is half water and half naptha gas. It works in diesel or gas engines.

I also recently tested a fuel treatment that promotes the fact that it has water in it. (In reality almost all of them do, though most don't promote it as a benefit. It is also in gas at the pump) . It has worked quite well in most of the vehicles that I've tried it in.

The truth is out there......

1.2kb works well, is tough and forgiving. Go just about anywhere and you'll find someone to "talk" to.

The 2.4kb and 9.6kb stuff never saw much use on VHF. Higher freqs work out better for higher baud rates, and are generally less congested as well. Most of the faster stuff is happening higher up.

I'm not saying that's how I would like to see it. .. I'm just saying that's how it is.

Actually, that's a form of pre-ignition, a different animal/different cause, with the same result as detonation. Detonation stemming from early timing/low octane/too high compression/lean mixture, or a combination thereof, occurs thus: The flame is started by the spark plug and the mixture begins to burn. As it does, the resulting expansion of hot gasses is compressing the remaining mixture in the cylinder, as is the rising piston. Under the right conditions, the unburned mixture auto-ignites and begins a new flame front. The inevitable collision of the two flame fronts produces the characteristic knock of detonation and the attendant equipment damage that results. Pre-ignition can occur in the absence of a spark. Remember the anti-diesel solenoids they used to put on carbs? You know why they were there; right?

<more snip of some accurate info>

> And when you run with less detonation in a engine, that means you can push the
> timing agressively up towards TDC, making more use of the resulting explosion.

No, and yes. We push the timing away from TDC, as in more advance, as in before TDC. And we aren't making use of an explosion, at least not in a gasoline engine. The air/fuel mixture burns (hopefully), as rapidly as we can make it. More advance, to a point and short of detonation, means more of the induced air/fuel mixture is burned, which obviously means more efficiency and more power produced as we approach that magical .5 lb fuel per horsepower per hour figure. The optimum advance figure varies, based on the many characteristics of the engine that determine the _time_ required to achieve complete combustion. Obviously, advancing the ignition timing beyond that optimum point begins to reduce horsepower output, even if detonation isn't occurring. The goal isn't to run with less detonation, it is to run with _no_ detonation. Detonation always reduces power production.

BTW, if it's using explosions it's most likely a diesel-they detonate by design... And yes, I know you knew it was advance, but that's not what you said. Which leads to my final point.

If you're gonna crawl in the pulpit, it's a good idea to have all your facts straight. And FWIW, I've been teaching folks for many years now, and I've never found it productive to tell them how stupid they are. There is a profound difference between teaching and tooting.

To those who wonder what this has to do with amateur radio, me too. My apologies if you are offended.

Hopefully, there is no one left reading this thread that still thinks detonation is "valve rattle" :-)

What speed should the water be injected 300 bps or maybe 56 k bps?
Should it be AM or FM modulated?

:
: ROTFLOL!!!! (rolling on the floor laughing out loud!)
:
: Because we are lazy. There are very few people that are willing to
: activly
: build and upgrade packet networks. In my area there is only four people
: (self
: included) that work on the network, and 45 people that use it. Those
: numbers
: become worse in large areas. Pretty soon everyone is frusturated with
: the
: network and it dies off.
:
: If you are interested in 19200 and up you should find a few people in
: your
: area with similar intrests and make it happen. You might lack the
: knowledge
: and experience required, but your enthuasiasm (sp?) will make up for it.
: Hopefully.
:
Also most people now adays are of the plug-n-play (plug-n-pray)
mentality. They want to be able to take it out of the box, plug
it in and have it work with as little tweaking and learning about
the equipment as possible.

> off the shelf for 56K. Aside from the slightly high, though reasonable
> considering the numbers they probably do on this kind of thing, price, am
> I missing something?

The WA4DSY modem is an excellent modem. Paccomm is shipping them today
for their
listed price. The "catch" is that the radio is IF only. Meaning you need
to
purcashe a transverter for the band you want it on. The if output is in
the 10
meter band, and more then likely you would be putting on 70cm. That adds
another
$300! Read up on hte modem @ http://wa4dsy.radio.org/ There is a
required parts
list their as well. Allmost forgot an interface to the PC as well! For
the PI2 card
you will put down another $125.

This is sounding really negative - it isn't supposed to. For $909 you
can have a
complete 56KB, wireless, data link. Quite a bit out of my budget, but
certainly
not for a network group. Once our 9600 repeater gets on the air, I'll
prolly
start thinking of a decent speed backbone too!

> I'm afraid ham radio bands have one dead repeater every 15Khz, with a guy
> sitting by the radio, waiting to tell anyone who tries talking, "This
> is a closed repeater." Could you put it on 219Mhz? What's the deal
> on that?

We have 5 repeaters in our town of 25,000 - with prolly only 100 hams
that use
FM. In Minnesota and Wisconsin (we are right on the border, here in
Winona)
every repeater pair in 2-meters is full... I find the whole thing
ludicris.
The repeater cordinators value digital repeaters far less then voice. In
fact
many of them have a tendecy to ignore requests for cordination.

220MHz is certainly a possiblity. I see a couple of disadvantages
though. First
we (hams) might not be keeping the band too much longer. Second, we

allready
have a set of cans (duplexers) for 2-meters. Third, we already have 10
data
radios on two meters simplex! I would love to move up to 70cm though.
The problem
becomes those 10 data radio @ $130 a piece. If a single party would be
interested
in getting 5 or so MFJ-8621 data radio tuned for 147.555 we might be
able to trade
up to TEKK radios.

In the days of high compression engines and only low octane fuel I built a few water injection systems that worked very well to reduce engine knocking and running on. I'm an engine tuner, not a rocket scientist so I'll leave the theory to the experts, but I will tell you they work.... with an added benefit of permanently de-coking your CC's.

I usually used a windshield washer tank and pump plumbed to a spinal syringe inserted in the intake manifold. The electrics were vacuum operated, I usually used a vacuum advance diaphram connected to a microswitch with a spring on a threaded fitting to adjust the moment of vacuum that was suitable for the particular engine. Sometimes I had a manual override switch to inject when towing up steep grades or other high demand situations. I never did dyno testing on the units, but they certainly ran better.

There *is* an application void. It is the classic chicken and egg problem. Without a high speed infrastructure, applications requiring higher speeds won't be developed. And without opplications, there is no incentive to upgrade the infrastructure. The local packet community has to get off the dime for progress to occur.

Waiting for the killer amateur app requiring high speed services to be written is a guarantee of stagnation. Higher speed infrastructure needs to be in place first to make the killer amateur radio app possible. In fact there are killer apps which could be adopted from the internet to packet today if the packet infrastructure were upgraded. There's no need to wait for a pure amateur radio app demanding high speeds to be written. And some of us haven't waited. We can run nearly any app that runs on the internet on our local packet net instead. At 56 kb, it's as snappy as the fastest dialup, but it is running on *our* network, which we control, rather than on some commercial service's network which they control. That lets us do things we can't do over the internet, such as experimenting with routing protocols and topologies, link layer protocols, congestion control, network hardware, etc.

One of the mistakes made early on in packet development was the approach of treating packet as an accessory for a voice grade FM radio. There was no room for growth in that approach. Digital signaling needs radios designed to do digital signaling, IE a RF modem.

RF modems needn't be as complex as TAPR's SS radio project, or even as complex as the MSK WA4DSY modem. They can be as simple as the Kantronics D4-10, using ordinary FSK and the slicer built into the radio for 19.2 kb operation, or the Slovenian radio modems operating at 1.2 Mb using simple FSK. Any amateur should be able to understand them and implement them. In many cases, a RF modem is cheaper than buying a TNC and dedicating

a voice grade FM radio to it. And the potential for performance growth is much greater.

Those who desire to construct equipment should be encouraged to avoid the AFSK over a voice grade FM radio approach. They should be encouraged to start with a simple RF modem approach. Equipment complexity is barely different from the simplest CW equipment. Potential digital hams should be encouraged to do radio, not audio. That's an approach which pays richer dividends.

But packet is by nature a cooperative enterprise. It doesn't happen in a vacuum. A *group* must decide to commit to a particular approach in their area. Lone hams can't do anything. It takes a minimum of two stations to do any sort of digital operation. And it takes more than two to form a critical mass which will sustain itself past the "gee it works" stage.

To move beyond 1200 baud AFSK, it is essential that the cultural dynamic be addressed first. People must be convinced that the old way is embarassingly outdated. And that much more utility, not to mention coolness, will be achieved if they move up to the latest techniques.

This is the basis of nearly all advertising and product placement, and it is also a necessary component of goal oriented political leadership. It helps if what you are pushing actually is better than the status quo, of course. And in this case it is better, much better.

>N2SPP

That's certainly a bitter enough comment, even if it does contain a grain of truth. I think we must realize that builders have been a minority of amateurs for quite a long time now. Like it or not, most hams have become appliance operators, unable or unwilling to open up their appliances, so we have to offer them appliance solutions. But those solutions do not have to be AFSK over voice grade FM radios. That's a dead end approach.

GRAPES mined the builder minority for 8 years with the 56 kb RF modem kits. That vein is nearly exhausted. So Dale developed a new version of the RF modem and got PacComm to produce it as a plug and play appliance. One doesn't have to be a rocket scientist to get on higher speed packet anymore (not that one ever did if truth be known, but that impression seems common in the amateur community).

It would be helpful if other high speed RF appliances were on the market. That would help gather momentum for a mass changeover to more competent packet technology. Digital amateurs should start thinking radio instead of audio.

This requires a *group* effort of course. Lone wolves can't do much in an inherently cooperative effort like packet networking. If people interested in higher speed packet can convince just one other ham to try it, they can demonstrate the benefits to the rest of their local community, and start the ball rolling toward updating the local infrastructure.

But a person needs to be inquisitive and a bit adventurous to do this. Timid followers won't get very far. One needs the spirit to buck the status quo, to break with tradition and explore new avenues, even if only with a baby step. Sadly, too few of today's amateurs seem to have that spirit.

I don't think you'll get much argument from me about that. I'm not convinced SS offers us any tangible benefits at this time in the spectrum where it will be allowed. TAPR's approach seems certain to be expensive, and likely to cause us all a bunch of networking headaches. I'm not sure how we can arrange a topology that will work with SS given our sparse on the ground situation. I'm afraid it is destined to be a novelty. And perhaps too little too late, like the TAPR NNC.

>I missing something?

The RF modems are shipping. I have one here. All the necessary parts are off the shelf, though you have to go to more than one vendor to get them. Remember that you need a transverter, I use the MMT432S, and you need a bit pump, I use the Ottawa PI2 card, in order to complete the

station. I figure I have $639 in the entire package (modem $349, flea market transverter $165, PI2 card $125).

Compare that to a Tiny 2, NB9600, and a 9600 baud ready (really ready) FM radio (Tekk KS900) at a total cost of $430. Two thirds the cost for six times lesser performance doesn't seem like such a good deal.

>on that?

The 219 MHz band is only available for fixed point to point links. They have to be coordinated with the waterways service to ensure non-interference. That's feasible for backbone use, but no good for user access. We do user access on the 222 MHz and 70cm bands via 56 kb digital repeaters serving the various LANs. Negotiating for sites is *the* big issue in network building. Good sites are hard to find, and even harder to find for free. The RF environments tend to be intense on the sites which can be obtained. The 56 kb RF modem has proved to be able to live on such sites. A SS system has yet to show the ability to do so.

Well, perhaps the *second* most inefficient communications
mode known to man. There is another much more demanding
of operator resources. But in general I agree that HF packet
as currently done is an abomination. Any of the TOR modes
will perform better. It doesn't *have* to be this way. HF packet
could be made to work well, but not the way it is being done
today.

I read this as saying a voice radio that has a connector for 200Kbps
is just not ever going to be practical. Right? Is the Grapes 10M IF
thing likely what future modems would look like? Or would the modem
more likely go to 900Mhz/440 directly?

>
> GRAPES mined the builder minority for 8 years with the 56 kb RF

> in the amateur community).

You know from my perspective, Grapes is expensive but also kind
of tantalizing. Here's where I am. I have a HF ssb radio a 2m FM mobile
and atnc. With Grapes, I get hit for $350 for the modem + $400
or so for the transverter + $150 for the tnc card. Still
maybe this wouldn't be so bad if I could use the 440Mhz
transverter for the VHF ssb constests or maybe JO-20/29.

Now, to do 9600 baud at 440Mhz.
I figure to get on that I need a 9600 baud modem, and some kind
of better radio for 440. Realistically this is going to be
about $500 bucks or so, I guess. If I want to do SSB on 440Mhz
also it comes out higher depending on what I get.

Still, to build a network of these systems it starts to
add up to real money. You need at least two to make
a network.

> It would be helpful if other high speed RF appliances were on the

And, really, it's so much time and effort to get a link system
setup and all that. Can you imagine sticking a hand made, one
of a kind modem out at a site whet

What I don't understand is whether you can setup 56K baud type of modems
with omni antennas as a BBS type system. Or put a 56K baud digipeater
on a hilltop? Could users connect at 56K
just like they use 1200baud now? Or would multi-path just murder the
signals. Do the higher speed modems require directional antennas --
and all that. From what I've seen on the web sites, it looks like
high speed pretty much means point to point links -- right?

1468. Old Kan TNC's for C64 C128

What is a blinker? I mean, there are the types that actually interrupt current flow for the purpose of flashing a lamp, and is even used as slang for turn signal in America, but what does it mean in the UK? At first I thought it was what people here called blinders (of the horses type, but for humans, usually used to mean "a block to reason"), but you have used it over and over, so now I have a curiousity as to what is meant.

If "a block to reason" is what is meant, you have your own "blinkers" on this subject.

Sincerely,

Pearce - KF4MOK

How does your exhaust system hold up? Also, I think the main drawback of
a water injected system is head gasket removal (a way of saying cylinder
overpressure) and valve erosion, but I have never played with it.

> One should understand that there are many different configurations of water

And the gains would be so, if there was probably a roughly 30% reduction
in horsepower. Perhaps Gary could calculate the exact amount, since he
has the formulas and test apparatus. Not to mention this thing really
must have been heck on head gaskets. Perhaps this experiment is better
to be performed in a Rodeck?
(solid head/block assembly).

>
> Also, of possible interest:
> Have you seen anything on Rudolph Gunnermans A-21 fuel?

But the key to mixing water and gas, is alcohol. Alcohol readily
dissolves water.

As much as I support experimentation with SS, I have to agree
with Gary for the time being WRT networking using SS *at UHF*
... as Gary has said, the place where SS could *really* provide
some immediate benefit would be in other bands ... like HF, as
Gary has said ... I also believe that digital voice using SS
could eliminate the mess, waste, and "spectrum warehousing"
that goes with conventional FM repeaters and the "coordination"
bodies that spring up to protect the status quo of the haves vs.
the have-nots.

Unfortunately that "cultural dynamic" isn't very dynamic, with
huge numbers of hams being ill-prepared to even understand the
"why" of the argument, let alone the "how" of how-to-do-it.

I guess I'd rephrase your statement to say bluntly:

"To move beyond 1200 baud AFSK, it is essential that the current
cultural *stagnation and ignorance* be addressed first."

Until more hams understand that there really things that ARE
FAR better than OOK Morse and that the real world has
progressed beyond the 1930s or 40s, we are destined to remain
stagnant overall.

The requirements for an analog NBFM voice radio and for a 200+ Kbps
data radio are pretty different. It is unlikely that they would be combined in
a single unit. They'd essentially need separate receiver sections for the
two modes, and separate transmitter sections for the two modes. There
would be little cost savings to combining them in one case.

GRAPES (really WA4DSY) chose to use the superhet principle with the
RF front end supplied by a transverter to increase the flexibility of the
RF modem. It allows someone to use the same modem on any of several
VHF/UHF bands of their choice by appropriate choice of transverter.
A monobander operating directly on a particular band could be cheaper
overall by combining the IF and RF front end in the same case. But this
restricts flexibility.

We use the GRAPES modem on three different bands in our network.
If it didn't use the transverter approach, we would have needed three
different modem designs. At the volumes being deployed, that wouldn't
have been cost effective to do. The flexibility to use different bands to
suit propagation and RF interference issues on various paths is a valuable
asset. We judge that to be worth the hassle of having to use two boxes
instead of one. For a high volume mass produced product, it might be
worthwhile to consider an integrated monoband design instead.

>a network.

Yes. I posted my costs in another post. 56 kb on 70cm at my station
cost $639. A 9600 baud setup cost $430. Two thirds the cost for
six times less performance isn't a very good deal. Trying for dual
use is probably only going to lead to frustration. If you want to do
digital, you need to set your mind on the idea that you'll need to
dedicate equipment to the job. The essence of digital networking
is that it is always there, always working, 24x7. You lose a lot of
the advantages of digital operation if you only have a station up
intermittantly.

>> It would be helpful if other high speed RF appliances were on the

>of a kind modem out at a site whet

Remember that networking is a group effort. All the links should
use the same equipment, so you'll never run into a one of a kind
situation. And several people in the group should have the necessary
expertise with the equipment, so the burden of keeping it going shouldn't
fall on one person. At least with something you've designed and built,
there is a far greater likelyhood that you'll know how to repair it if and
when that becomes necessary. With an appliance radio, that may be
a harder task.

>high speed pretty much means point to point links -- right?

We use 56 kb just like others use 1200 baud, only faster. We have a
couple of mobile stations in operation. They work fine. Multipath is
always an issue in situations where pure line of sight doesn't exist.
At higher symbol rates, the probability of ISI increases somewhat,
but our experience is that it isn't as bad as some have made it out
to be. In the mobiles, we have dropouts due to multipath, just as you
have picket fencing on analog voice. But just as with analog voice,
most of the time it works fine. And when you stop, you can almost
always find a spot where it works. Sometimes you have to move
a few feet one way or the other, just as you often have to do with
analog voice. Dale has added optional FEC to the current modem
to deal with dropped bits. That's lowered the retry rate for modems
in motion or in bad multipath locations a lot.

The network topology can use digipeaters, switches, or duplex
repeaters. We've used all of them. There really is no difference
from 1200 baud operation except for the speed. But that difference
is profound. The difference between 56 kb and 1200 baud has to
be experienced to be fully appreciated.

At 256 kbps or 1.2 Mbps, multipath is going to be more of an issue.
And to get the needed bandwidth, operation at upper UHF is going
to be required. Those things conspire to make use of directional
antennas more of a must. At 56 kb, we haven't reached the point
where such things are necessary. Most of us use omni antennas.
A few use beams. With our LANs centered around digital repeaters,
a beam at a user station becomes practical because we only have to
hear and be heard by the repeater. Use of a beam also means we
don't have to run much power. None of us is running over 7 watts.

>
> My question: Does anybody have any idea of the reason for using such an
> unusual data rate and choice of mark and space frequencies?

Rumor#1: So they are not easily reproducible by standard modems,
so the local prankster cannot trigger a false alert (although we
know that won't stop a determined "prankster").

Rumor#2: It's a compromise between bandwidth used and data rate.
Since the "alert" has to pass through multiple audio chains (some
not too good), it needs to be somewhat "robust", but it needs to
be fast enough not to take up too much time.

There is a an OES website for the California EAS system. There is
some good info there.

http://www.garlic.com/oes/eas.htm

There is some useful stuff at the bottom of this page:

http://www.thuneagle.com/same.html

The FCC has a page with PDF "manuals" for the broadcasters:

http://www.fcc.gov/cib/eas/

Hey Programmers! Is anybody working on software to decode the
EAS/SAME alerts? We're heading into Tornado Time. Here is a
chance to write something that may actually save lives!

Petit did the original amateur CCW work. Knowing where the timing edges must occur allows you to use integrate and dump symbol recovery techniques. Petit used a bucket brigade for that, but you can do it in software. The gain you get from that is proportional to the square root of the integration time. In other words, instead of trying to detect peak envelope against the noise, you can integrate symbol energy for the duration of the symbol and slice that against the integrated gaussian noise energy. Since noise is a random process, its energy averages out to zero when integrated. The signal is a coherent process, so its energy adds over the integration interval. Thus you get a gain in S/N.

For Morse symbols, the gain you get from integration isn't optimum because the code doesn't use uniform symbols and isn't fully voiced. So you wind up with only a 5.3 db S/N gain by using CCW (at the same speed as CW). Obviously, as you slow the CCW, the integration gain continues to increase. If you make the symbols 4 times as long, you get another 3 db of S/N gain. Make the symbols 16 times as long and you get 6 db more. Etc. Those copying by ear are unable to take advantage of this. By ear weak signal ability actually declines as the code speed drops below about 5 WPM. But you can run a CCW system with a bit time of 10 seconds or 100 seconds, etc. That gives you a total gain of 15.3 or 20.3 db respectively, which by ear operation can't touch. But the information rate becomes very low.

Note that with such long symbol times, the precision of GPS is more than you need. If the absolute timing is off by a few milliseconds, the loss of gain is insignificant. So you can just occasionally hack your local clock to WWV by hand and still get almost all of the gain you'd get if you used a GPS reference. The NMEA time string output by your GPS is plenty good enough to keep you in sync. So you don't need to go hacking inside for the high precision 1 PPS signal. If you wanted to run higher speeds, and shorter

symbols, then you'd need to go in and hack that signal out to your decoder. A rough rule of thumb is that you want the absolute timing error to stay below 1% of symbol time. With 100 second symbols, you could be off by 1 second and not suffer a significant gain penalty.

Of course, knowing timing edge location makes decoding Morse by machine a trivial process. There is none of the ambiguity which plagues machine decoding with randomly timed code. I don't know exactly how to quantify that improvement, but it is pretty significant. It may be as much as 20 db over machine decoding of randomly timed CW.

That doesn't represent a 20 db improvement over by ear decoding, however. That's a complex pattern recognition process, and the same scaling doesn't apply. Random CW machine decoders need a fairly good S/N to operate. Use of CCW eliminates the ambiguity which needs the good S/N to resolve, so it removes the by ear advantage and puts the machine decoder on an equal footing with the manual operator. But the total net advantage over by ear operation is still only the 5.3 db S/N improvement you get with CCW over CW at the same speed (assuming the speed is above 5 WPM, at very low speeds, the machine wins big time due to the increased integration gain).

You get a bigger improvement by going to a uniform code with a fully voiced modulation, for example, ASCII by PSK. That's worth 9.72 db even without external clock synchronization. With external clocking, the advantage grows to 19.72 db over Morse CW at the *same speed*. And you can still get more integration gain by lowering the speed as noted above. So with 100 second symbol times, ASCII by PSK would have a total advantage of 34.72 db over the best by ear Morse reception. This is why Voyager can operate from beyond the edge of the solar system.

The gang running Coherent has proved this out in amateur practice. They started by running CCW, but switched to ASCII by PSK to take advantage of the uniform symbol lengths and fully voiced modulation. They can copy that at much lower signal levels than they could CCW of the same speed. And of course both are copied at lower signal levels than async Morse.

Adding a strong FEC can improve things even further, of course. Up to another 20 db in coding gain can be achieved with a heavy duty FEC. Note that you can detect very much weaker signals if you set the slice level tighter. But that also increases the false alarm rate, IE the BER. You can use FEC to get the BER back down, so that's why FEC lets you work at weaker signal levels.

>Compared to 100mS/dit CCW, how does a 10x10mS Goertzel sampling window
>compare for asynchronous CW? Machine generated vs human generated? In
>other words, if the CW wpm is machine generated and known, what dB
>advantage is that for asynchronous CW?

That sort of windowing of async CW only gains you about 3.5 db at 12 WPM over ordinary envelope following. That's not to be sneered at, but you now have the ambiguity in machine decoding back because you're operating async, and that can

cost you up to 20 db compared to by ear decoding. So this won't win the contest between man and machine. CCW can let you win, and switching to a uniform code and fully voiced modulation can let you win even running async, and lets you win big time if you're running externally synced.

Note, all of the above applies to a gaussian noise channel. HF is a more complex channel than that. There are various characteristic fading rates, multipath ISI, and impulse noises to be considered, as well as interference from other signals. Those all need to be considered in a robust signal design. Experience teaches us that long fully voiced uniform symbols are effective against most of these channel defects. Wide shift can also be useful. And robust FEC is a much larger help against this sort of channel than it is against the pure gaussian noise channel.

It is usually worthwhile to use QPSK and a convolutional code with a constraint length of 20 bits or so on the HF channel. On a pure gaussian channel, BPSK and an interleaved block code will generally be the better choice. Turbo coding is probably not necessary for the HF channel, but can be rewarding on the pure gaussian channel for ultimate weak signal operation.

We can, but why stop there? We might as well do 56 kb instead. That's legal on VHF (but not 2m). On 2m we're limited to a 20 kHz bandwidth. That means we can't use AFSK over FM for 19.6 kb, and we can't use ordinary FSK. Both would be too wide. We have to use a more complex modulation and specialized radios. And if we're going to that much trouble, why not move up to 219 MHz or above and run 56 kb?

Yeah, I looked on the wa4dsy, I think it was, web site, it and looks like in Georgia, there's a pretty impressive network. Showing full duplex digital links between mountain tops. It looks to me, pretty much, like the network that everyone's whining that hams don't have -- setup there in Georgia.

Are you involved with the building and maintanence of it, Gary? Is the planned expansion, shown on the map, into Tennesee and Alabama still on track? Do you guys know where the bottlenecks are in the current setup? Are there plans, or is there a need, to move beyond 56K on any links?

And, like does anyone know what kind of money is involved in renting a site at a hilltop? Is it, like $100 a month or like $1000 a month? Where do you find this out -- are these sites in the yellow pages? If the rent is anything at all, I'd think it'd blow out the cost of equipment pretty quickly. I imagine here in Caliornia, everthing would be more expensive -- as usual.

or could you get anything useful at all, linking between people's houses?

David,

I'd love to see which "supporter" has "admitted" this!
Anyone that mistakes the GEET for water injection has little understanding of it. Water injection is an "add on" that simply supplies water to aid combustion. The GEET does not need water at all to work. At the same time, in a slightly different configuration, it can burn large amounts(up to 85%) of water with little hydrocarbon fuel. Either way I fail to see how it can be confused with water injection.

Thanks....

Grant

We routinely grant administrative rights to users that require it.
Typically, however, root is only needed for "make install".

Even on a single user unix system, exclusively logging in as root is a bad
idea IMHO.

No it does not.

Compare apples to apples. If someone wants to ftp some unix software to
compile and play with and they have a private linux box on a 28.8 line, it
will take them a lot longer than if they ftp the same unix software onto a
proshell account through our T1.

>Then it wouldn't be "my linux box" and I'd still have to dial-up. :(
>I run linux on a cable modem now. It kicks ass. I'll never go back to
>MS-Sucks.

The cost of a cable modem is far higher than a proshell account.
Moreover,
our T1 is dedicated bandwidth.

>: 2. If you want someone else to deal with administratrivia.

>Personally, that's the fun part. Hell, everyone in my family, even my
>friends, have an email address that starts with their first names! ;)

We routinely give email addresses with user first names. Also, if you
want complete control of your email namespace, we will MX
a proshell user's domain for free.

>: 3. If you don't already know unix and want friendly tech support.

>Ruins the fun...

No one will force you to use the tech support.

>: 4. If you want access to a local news machine but can't afford 20 Gigs of
>: disk space.

>You can do this with any type system.

Of course, but the difference is with a proshell account, you don't have
to pay for a 20 Gig disk or the 128 Megs of RAM a news server demands!

>: 5. If you want a fax receive service

>See answer to above.

And, with proshell, you don't have to pay for a dedicated fax phone line
or leave a computer on 24 hours.

You need to pay some phone bill, because an unnetworked computer is not
nearly as useful as a networked computer.

Our security policies are not intrusive.

We don't have disk quotas.

We often give root access to qualified users with a legitamate need for
it.

We encourage our users to install software.

on-parliamentary parties.

That impudent propaganda of Polish integration with NATO brings adverse effects. People feel that it is a non-democratic attempt to impose American and West European power on Poland. This results in growing resentment towards the USA and Western Europe. But first of all such operation would entail enormous costs for Poland, a sudden slump of the weapon manufacturing industry and drastic reduction of the Polish army to 180 000 soldiers whereas Germany possesses 600 000 soldiers. NATO is viewed by the Polish society as a means of dismantling Poland and replacing the Polish Army by foreign, mostly German, military forces. This poses a serious danger to Poland because of the neo-Nazi aura in Germany and, above all, in the German Army. People in Poland are alarmed by a growing domination of Germany in the NATO structures and by pan-Germanic tendencies in reunified Germany.

People in Poland are afraid that integration with NATO will antagonize Poland and other Slavonic states, such as Russia, and Poland's close neighours: Belarus and Ukraine. NATO's presence in Poland is a threat not only to the Polish nation and other Slavonic countries, but also to Europe and the world. The American and European policy of confrontation with Russia would make any peace treaties or disarmament agreements impossible and might cause excessive armament race. The Western countries should remember that the NATO expansion means a new division of Europe resulting in a potential military conflict and in the isolation of Russia from the rest of the world. The NATO-free Poland should be a link between Russia and Western Europe, and, as a result, would bring considerable benefits to the USA and Europe.

We do hope that a thorough analysis of the issues presented above will be of reciprocal benefit not only to Poland and the USA, but also to the peace process in all the countries of Europe and the world.

Hi
thank&#65533;s for read this,i &#65533;m try found some " YamModem Builder&#65533;s",for change opinions ,about the contruntion problems ,and the " FPGA" configuration.My YamModem work in " CONFIGURATION fase" ... i use the " Yamser05" drive for Flexnet Sofware (the best sof. i Know). Every time when i load the Flexnet ,next the Yamser05 (at this moment the Yam is a Live !), i see with an osciloscope the " TXclock," "RXclock" and " 2.4576Mhz oscilation"...next when active the " Flex" this signals STOP !

CONCLUSION (My)
When this happen the " RTS " and " DTR" (at moment i active the Flex),her l&#65533;gical state change, made Power Supply (provided by this two pins) drop and of course the FPGA configuration UNLOAD.

So if somebody BUILDE the Yam and have solution for this ,please inform...

Thanks in advance ,
Paulo Gariso_CT1DTA

The demonstrator engines that the dealers have will run at least 50% water. The original Briggs engine with the heated aluminum bubble chamber can burn more. Just contact a rep and arrange a demonstration. I was allowed to put whatever I wanted in it and operated controls myself. Unit was torn down and inspected. No hidden tanks no tricks.....

1503. Questions on shortwave decoding

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-20 00:00:00 UTC
From: jocatch@ibm.net
Message-ID: <6etsjkudq1@mdnews.btv.ibm.com>
Source record: 24865

I just got a new Drake R8B and I want to start learning how to decode weather faxes, RTTY (both Ham and non-Ham), faxes, and anything interesting on shortwave. I got a program called something like BLT which uses the Sound Blaster to do the A to D and last night I found one RTTY signal at 3623.62 khz. I was able to decode it although the tuning was very touchy. I have almost zero money to devote to this so any decoders I need, I need to use either my sound card or need to be able to build it myself.

1. Where can I find a list of frequencies commonly used for RTTY, faxes, etc?
2. I have the plans to build Hamcomm. Is it any good? With that and software, what can I decode?
3. What are some good programs that use a sound card?
4. What programs use Hamcomm?
5. How do I find out what each mode of transmission sounds like?
6. What about SSTV? Is there much of it on shortwave? Any SSTV programs that use the sound card?
7. Any good web sites on this subject?

Joe C.

Here I am ! :-) YAM is a great modem, I hope I'll be able to help you.

First of all, new configurations files have recenty been uploaded
on the Italian server, you should use them and make a new
attempt.

I also noticed that YAM only works with 16550 COM ports, all
my attemps with my 16450 board didn't give any results. Maybe
it's your problem...

I'm past president of the EAL (East Atlanta LAN) which is
responsible for the Bell Center and Lanier Mtn sites. And
I'm a former member of the GRAPES board of directors.
I served on the technical committee during the bulk of the
construction of the network. I'm not as heavily involved
today as I was back then. My interest has turned to weak
signal HF, but I still help out from time to time.

The Lanier Mtn full duplex site is fully operational now.
It is a tri-speed setup supporting 56 kb, 9.6 kb, and 1200
baud users via a common switch (router). The links into
Auburn Ala are not yet complete. We are interlinked at
9.6 kb into ALANET via a Sweat Mtn to Mt Cheaha link.
(Sweat is also a tri-speed switch.) ALANET is supposed

to have a plan to upgrade their major trunks to 56 kb statewide. I don't know how that's progressing.

The 56 kb link to Covenant College in Chattanooga Tenn (Lookout Mtn) has been operational for some time. At the moment the Pine Log Mtn relay site is down, so we're long hopping 56 kb simplex from Sweat Mtn. (We're looking for a new site manager for Pine Log, the old one has had to ease off due to health problems.)

I understand that TENNET is working to extend their part of the network into Nashville. I believe the hop to Monteagle (University of the South) is complete, but I haven't seen a progress report recently. TENNET says they have a plan to link all of their major population centers at 56 kb. Their state EMA is supposedly helping with funding and sites.

I also understand that plans are in the works to extend from Sky Valley into Asheville NC and Greenville SC by groups in those areas. (Out of state links are beyond GRAPES' area of responsibility.)

One sore point is that we haven't been able to get a local group to form up a LAN to serve Athens (University of Georgia). We could link them from Lanier, but they have to supply a site and a local LAN organization to support it. Georgia Tech was easy, but we haven't had a similar response from UGA students or staff. (That's AFAIK, I'm not on the GRAPES board anymore, so I don't know all the recent political details.)

South Georgia is another area we haven't been able to serve. The digital amateur density is too low and too dispersed to form effective LANs down there. There is a low speed network of digipeaters (nodes) run by individuals covering parts of South Georgia and linked into the southern part of ALANET. (South Georgia and Lower Alabama are fairly flat farm country. There aren't any convenient natural high sites, and population density is low.) We hope to serve them someday, but I suspect we'll see a branch of the network run down the coast from Augusta to Savannah first because of higher population density. We have done some HF experiments to give them limited access to the GRAPES network using 80m NVIS techniques. That's very slow, but it does work.

We aren't severely bottlenecked as of yet, but inspection of the map should show how key Sweat Mtn is to the network. The triangle formed by Sweat, Bell Center, and Lanier could benefit from higher speed trunks. The technical committee has been experimenting with various faster technologies to find the best way to do that. We've tried some commercial SS equipment with nil success. Some of our GA Tech boys are now experimenting with Slovenian 1.2 Mb equipment.

That looks promising, but we need a better way to interface
that to our switches.

>And, like does anyone know what kind of money is involved in
>renting a site at a hilltop? Is it, like $100 a month or like
>$1000 a month? Where do you find this out -- are these sites
>in the yellow pages? If the rent is anything at all, I'd think
>it'd blow out the cost of equipment pretty quickly. I imagine
>here in Caliornia, everthing would be more expensive -- as
>usual.

A good site typically rents for $400 a month per antenna plus
utilities. We've been fortunate in getting space donated or
discounted, so we don't actually have to pay that rate at most
of our sites. If we did, it would totally dominate network costs.
But because sites are available on sufferance, network planning
and stability are less secure than we'd like.

>or could you get anything useful at all, linking between
>people's houses?

Basically, no. Very few of our members are line of sight to
another member. Without the high sites, we'd have very
little connectivity. And realize that the Atlanta area is the
10th largest population metropolitan area in the US. Most
everywhere else, any amateur network is even more sparse
and even more dependent on the availability of high sites
to tie it together.

I've never had any problems with the exhaust or the cylinder heads, though other have said there are potential problems. Somewhere in the information I've gathered it warns not to use it with a very rich mixture.

> How does your exhaust system hold up? Also, I think the main drawback of

Power went up about 15hp, due to the compression increase. This was on a small 4 cyl.

> And the gains would be so, if there was probably a roughly 30% reduction

I don't think they were looking for a power increase? Just a cheaper, cleaner alternative. There ARE major problem when using water in this way. When you are feeding the engine larger amounts of water like this, every time that you shut off the engine you end up with water in the cylinder. My sources said that engine life, when using large amounts of water in this way, was cut dramatically. I have a video of Gunnerman running this fuel in his Porsche,

it didn't seem to suffer any power loss. But if engine life is reduced I'd hate to be replacing a Porsche engine every 2 years.

> >

Actually, alcohol does work fairly well for this. Another alternative that works at least as well, that almost everyone has on hand is liquid dish washing soap. Only takes a little to mix a fairly large amount of water with the gas. Using a strong dish detergant, some isopropyl, and a few other surfactants I was able to mix 35% deionized water with gas. Car ran pretty decent. It did make readily apparent the weakness of my very old point ignition however.

I don't think it is practical to feed this type of fuel into an engine via conventional fuel systems. I also forsee problems with it during our rather cold winters.

> But the key to mixing water and gas, is alcohol. Alcohol readily

Gordon West Radio School Presents:
T W O Special Classes!

No-Code Technician Amateur Radio
Licensing Class For Mariners
Friday June 5th, Saturday June 6th and Sunday June 7th 1998
At the lovely Del Rey Yacht Club, Palawan Way, Marina Del Rey, CA.

And…

General 13-wpm Morse Code
And Theory Review Class
Saturday June 6th and Sunday June 7th 1998
At the lovely Del Rey Yacht Club, Palawan Way, Marina Del Rey, CA.

No-Code Technician Class for Mariners -- Class Instructor: Gordon West,
=================================== WB6NOA
This special class is designed specifically with mariners in mind. Learn how Ham Radio can make your next cruise even more fun! Stay in touch with fellow hams as you sail down to Baja, use ham radio phone patches to keep family and friends advised of your position. This fun and entertaining two-and-a-half day class starts on Friday afternoon and covers everything you need to get your Federal Communications Commission No-Code Technician license. Take the two multiple-choice exams right there in class and get your callsign two or three days later! Students who pre-register will receive the Gordon West "No-Code Technician Plus" textbook, theory cassettes, and a special pre-study package. The class fee includes nineteen hours of tuition, beverages, lunch on both days, a barbecue on Saturday night, and a special Saturday night after-class workshop detailing marine installation and use of ham radio onboard yachts and powerboats.

General 13-wpm Morse Code
and Theory Review Class -- Class Instructor: Julian Frost, N3JF
========================
This class is for mariners that want to upgrade to the General Class license, but like many people, find the 13wpm Morse Code requirement their biggest stumbling block! Make 1998 your year to upgrade. Don't let the Code hold you back any longer, the Worldwide HF bands are waiting for you. In fun, stress-free way, your instructor will take you from a shaky 5-7-wpm all the way up to 13-wpm, or higher, in preparation for your exam on Sunday afternoon! Techniques in passing the CW exam will be taught, and there will be multiple demonstrations showing just how easy it is for YOU to pass the 13-wpm, or even the 20-wpm code exam! Theory review sessions are held throughout the two days to help make passing the written exam even easier. Students that pre-register will receive the Gordon West

"General Class" textbook, Gordo's exclusive CW tapes, and a special pre-study package. The class fee includes sixteen hours of tuition, beverages and lunch on both days and a barbecue on Saturday evening. General Class students join Gordo and his No-Code Technician class for an operating session and workshop dedicated to installing, using and maintaining ham radio equipment aboard yachts and powerboats.

--==--

For full details on either of the classes described above, please call Gordon West at (714) 549-5000 between 10am and 4pm, Monday through Friday.

From: qwasty@hotmail.com
Message-ID: <6eubotnmg1@nnrp1.dejanews.com>
Source record: 24871

I'm going to Utah State University this fall, I would like to spur some interest in high speed packet in my area by connecting the internet connection (Ethernet) in my dormitory to my microwave network. I could encourage people to try it out by letting them use my hi-speed internet account. sure beats buying a T1 line. How difficult is it to do this? keep in mind i am a highschool student with no experience with packet or networking yet.

1510. Re: common hi-speed packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-20 00:00:00 UTC
From: Steve Sampson <ssampson@access.usa-site.net>
Message-ID: <3512CC9B.9545872D@access.usa-site.net>
Source record: 24872

You better become familiar with the "fair use" limitations of the schools network.

In most cases, the schools are locking down the network and external
connections that bypass the firewall would surely be frowned upon.

In the old days (5 years ago) you could get away with it, but most schools
are under constant attack be criminals and hooligans. Some schools are even
blocking certain protocols (such as IP in IP, etc). The days of discovery
outside the lab, are pretty much over.

The answer to your question is: expensive and hard unless you design
a point-to-point system using a FSK scheme. What the big boys are
using now is split-band Spread Spectrum. That is, say 3 GHz center
freq on one side, and 5 GHz center on the other (for T1 speed full-
duplex). What will bring prices down is innovative antenna designs,
mass production, and all-in-one chipsets. If you want to see some
really neat antenna designs, look at the Marine radars today. They
are basically a strip-line design with the whole thing being a PC
board. Research that for three years, and then do your Senior
project on that (that is, if you are going to engineering school).

Source record: 24786

Anyone tied to use the MX614 from MX-COM? Bell 202 compatable and 1200 baud. Maybe there is a way to multply the clock frequency so that it would be switchable between 1200 and various other rates so that it could be switched with only writing to a control register?

1517. Re: common hi-speed packet

Newsgroup: rec.radio.amateur.digital.misc

From: Jim Devenport <jdport@concentric.net>
Message-ID: <3513662F.52AA@concentric.net>
Source record: 24787

Site rental prices vary according to the site. The best ones of course
cost quite a bit (last quote I got from a site administrator for Tesuque
Peak [12,000 ft overlooking Santa Fe NM] was $100 a month for one box
and one antenna on the tower, when I griped that I was not going to be
making money on the system but providing a public service the price was
offered for half: $50 a month which was still prohibitive of course.
Politically, sites are even harder to obtain. Even the major cellular
systems have trouble getting sites approved and they have **deep**
pockets. Our society wants the convenience of cell phones and
communications (better pub safety comms too) but does not want to
tolerate those nasty towers on hills, mountains, or midtown.
So I'm a bit grumpy about the future of good RF sites.

Hi Eric,
nice found some "Yam BUILDER" or possibel , :-))

>First of all, new configurations files have recenty been uploaded
>on the Italian server, you should use them and make a new
>attempt.
The last drive&#65533;s i have is the "Yamser05" for the Flexnet...so
the story is the same...

1&#65533; Load, Flexnet

2&#65533; Yamser05,
the FPGA load well the configuration, i HAVE " TXclock,Rxclock,and
2.4576mhz oscilation" ....BUT
when i active the "FLEX" everithing STOP !

CONCLUSION (My)
When this happen the " RTS " and " DTR" (at moment i active the
Flex),her l&#65533;gical state change, made Power Supply (provided by this
two pins) drop and of course the FPGA configuration UNLOAD.

>I also noticed that YAM only works with 16550 COM ports, all
>my attemps with my 16450 board didn't give any results. Maybe
>it's your problem...

NO, have 16550 COM ports, i think the problem stay on the DRIVES,the
old Drives (yaminit Yam110.mcs) NEVER load ,Never i see the
TX/Rx/Osc,signals before (yamser05).

Thanks in advance ...

1519. Looking for M/AComm Gunnplexers

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-21 00:00:00 UTC
From: Boris Pran <boris.pran@os.tel.hr>
Message-ID: <6f06ii$38t@argos.tel.hr>
Source record: 24789

Please,

Can anyone tell me if Gunnplexers for 10GHz are still available. I know that M/ACom was selling those - don't know the current availability.
If someone knows where I can find a pair of gunnplexers (or something similar, from other manufacturer)and what would be the price - I would appreciate that information.

Thanks.

Boris / 9A3ZD

Yes, exactly. This is why it might be a good idea to look into Multicast on both HF and VHF/UHF as a way to get around the drawbacks of point-to-point networking. Multicast cannot REPLACE the existing network, but it can sure ENHANCE it.

There is an article and links at my URL below. A Ham-Web net (Multicast) does not require nearly as many physical sites as a standard point-to-point net would do, and the Ham-Web will move a lot more information per day - by an order of magnitude.

According to Ham-Web's author, a 1200 baud Ham-Web will consistently out-perform a 19.2kb point-to-point network, moving more data in the course of a day.

The author of Ham-Web says that the messages (not just headers) on a typical packet BBS can be distributed within a couple of hours... Ok, go ahead ands re-transmit the whole thing in case somebody missed something. -- That leaves you with 20 hours worth of transmission to fill. The author suggests the extra space be filled with HTML documents. Thus - "Ham-Web".

Sounds too good to be true? Check out the program's docs.

Don't forget to look into the legality of what you are considering. Will you be depriving the local commercial ISP of revenue with your "freebee" offer? Can you guarantee that there will NEVER be any information moved over your ham-radio links that is of commercial or pornographic nature?

I assume you do plan on hanging on to your ham ticket. Better think about it.

I couldn't get through to the web site, btw. Anyway, if we just hookup
tcp/ip to a 1200 baud connection, I don't think performance would be all
that good. It could be he's doing some kind of web page cache. Where
say, all the ham radio web pages in the world eventually make it into
a data stream that gets duplicated on hard drives across the country.

And, I can see getting something useful -- especially, if you're like in Alaska where building a point-to-point network would be really rough. Obviously the first person to click on a site located across the country would be in for a really long wait.

Still, there's more to the web than web pages. And, imo, high speed digital delivers a pile of uses beyond just what you get from looking at web pages. Besides, ham radio does manage to get sites going. Look at all those repeaters. If the locals feel the benefits are there, sites can happen. Partially, I think the value to the local club of putting up a node increases with the size of the network. But, those first few nodes cost some money, and don't really deliver that much bang for the buck.

Maybe there could be some kind of emergency justification for this. You know, as, say, local governments become more and more dependent on landline tcp/ip, perhaps there'd be a rational for building an ham radio based network. Also, here in the SF bay area, there are lots of boats, and I was thinking maybe this kind of network would be useful to communicate to these guys.

Source record: 24796

All of that info is on http://www.kantronics.com. You might want to also know that Kantronics and Creative Services Software are in the final development stages of an HF email client (called HF Mail '98) and are also working on a TCP/IP driver to interface web browers and email programs to the TNC's. This would mean you could use Eurdora or Netscape over the 9600 baud port of the 9612.

1527. Packet or Pactor for HF link

Source record: 24797

I need to set up an HF link for use between just a small group (2/3) stations 1000 to 1500 miles apart. At present we are using packet on 20m but we have multimode TNCs with pactor and the old amtor. Can anyone coment on the relative reliability of these modes. We are mainly leaving messages ineach others mailboxes and occasional on line chat. There is a requirement to exchange the odd small files which could be UU or similar encoded to 7 bit but which are too long for the average mailbox message. Packet seems to suffer badly from adjacent channel interference even with 500Hz filters. Would Pactor suffer similarly?

Jim,

$50 a month is "prohibitive" ??? ... what are you, a group of one?
(any idea what it costs to build and maintain a good site in a
location like the one you describe???)

If you can't get at least 10 people to support a system at $5/month
you probably don't have a good reason to put yet another system on
the air. IMHO vanity repeaters/nodes are as stupid and wasteful as
vanity callsigns ...

Systems like what I am aluding to generally exist to feed the ego of
the operator and to secure his/her claim to the exclusive use of a
frequency or pair of frequencies within a rather wide geographic area
through the status quo maintaining good-old-boy clubs called
"frequency
coordinators."

Jim, if you do not fit the picture I'm painting above, please don't
take this as a personal flame ... in fact, if you don't fit the
picture, you may well agree with what I said ...

HF Packet is used by pro-coders to prove how bad HF digital is
compared to CW. OTOH, I have found PACTOR to be extremely reliable
and I have seen it get through when fading rendered CW close to
useless. In my experience, PACTOR keeps working after CW gives up
and goes to bed. :-) While N5AQM was on a 4 month sabbatical travelling
through all the NorthWestern states, there was never a day that he and
I were not in contact using 40m PACTOR. He used a 40m Hustler mobile
antenna and often got through to Arizona with just 5 watts.

Source record: 24803

You'll find Amtor a big improvement over HF packet. Pactor-I an improvement over Amtor. If money is not an issue, Pactor-II is an improvement over Pactor-I. Clover with a Hal P38 is probably the best bargin for the money for what you want to do (some like Clover better than Pactor-II) provided you don't mind leaving the computer running. The PTC-II for Pactor-II is a stand alone box with built-in mailbox and rig scanning control.

Well, I was thinking that $50/month is in the ballpark of what's doable.
You know. Though I've never heard of a 'vanity node.' As far as I'm
concerned hams can build as many vanity nodes as they like. Especially if
they're at 56K or faster. If someone wants to build a node for
personal ego or whatever, so be it.

Besides the digital networks, especially the tcp/ip ones, I think
qualify as pretty much experimental. So, finding 10 people in the
neighborhood to do high speed packet is going to be rough until
a more extensive network is in place. Once a proper high speed
tcp/ip ham system going I do think we'll have trouble keeping people

from overloading the thing. But that's a ways off.

1535. [SoCal] On Air Code Practice 144.330 simplex

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-21 00:00:00 UTC
From: Julian Frost <jfrost@odaiko.ss.uci.edu>
Message-ID: <Pine.LNX.3.95.980321161818.4548F-100000@odaiko.ss.uci.edu>
Source record: 24805

If you're in Southern California, join me, Julian Frost, N3JF and Gordon West, WB6NOA for On the Air Code Practise, beginning Monday 23rd March, 1998 at 8pm. We'll be transmitting on 144.330 simplex and the WA6TWF Super System repeater cross-link which covers an area north of LA all the way down to the Mexican border.

Gordo and I will take four to six weeks preparing students to take their 5-wpm Novice Morse Code exam. After that, we'll be concentrating on increasing code speed for those that want to get their General Class license and pass the 13-wpm exam.

After the code practise, Gordo will host the "News Behind the News" net. An irreverent look at what's happening in the Ham Radio and Electronics industries... done in a way only Gordo can! :-)

So if you want to learn the code, or just increase your code speed, join us each Monday on 144.330 simplex (or on the WA6TWF Super System, if you are a member!) at 8pm. This is the stress free, fun way to learn code!

Talk to you on the air!

73,
Julian, N3JF

Storm damage at my ISP.. Try: http://home.texoma.net/~n5pvl until it
gets fixed.

>Anyway, if we just hookup
>tcp/ip to a 1200 baud connection, I don't think performance would be all
>that good. It could be he's doing some kind of web page cache.

I'm sorry. I wasn't very clear. Ham-Web does not use tcipip. It uses a
simplified version of the AMSAT multicast protocol, worked over for
terrestrial use.

Multicast is much like it sounds... One transmitter send a continuous
digital "broadcast" of ham-related information. Instead of sending to one
recieving station with which it maintains a connection (point-to-point) ,
the multicast server sends to multiple recipients, and is connected to none
of them. Much of the overhead and delays related to normal Pt-to-Pt
(connected links) links are eliminated. The multicast server transmits
continuously, not in fits and starts. This is part of the reason for it's
efficiency. When it has finished transmitting all it has in the queue, it
goes back to the beginning and starts over. If a recieving station misses a
bit of data first time around, it then has an opportunity to "fill in" the
gaps.

Secondly, there are multiple recievers for each transmitter. This is so
simple, yet so powerful that it tends to be overlooked. Actually, the
multiple/parallel distribution of the data to many client stations at once
is what makes Ham-Web (Multicast) able to distribute more data over wide
areas, faster than point-to-point networks operating at much higher baud
rates.

>Where
>say, all the ham radio web pages in the world eventually make it into
>a data stream that gets duplicated on hard drives across the country.

>the country would be in for a really long wait.

Ham-Web is, I believe, intended for use in local VHF/UHF networks running at 1200 baud or better. I noticed that the software has provision for 300 baud operation as well, which leads me to think it's usable on HF.

Ham-Webs on the low bands could be useful over a radius of several hundred miles, and that's where I would like to run it. At this point I'm having to wait on a new serial port card, in order to try it out for myself. Soon I'll experiment on two-meters, and if all goes well there, I'll go on to HF, where multicast would probably do the most good. (IMHO)

>Still, there's more to the web than web pages. And, imo, high speed

>there, sites can happen. Partially, I think the value to the
>local club of putting up a node increases with the size of the network.
>But, those first few nodes cost some money, and don't really deliver
>that much bang for the buck.

You have to "know somebody" in order to get tower space. You have to have your 400 ft of 7/8" heliax ready to go, along with your ground crew, antenna, ect.ect. Sure it happens. BUT the guys who "know somebody" and can do this sort of thing are getting scarce. Some have gotten disgusted or bored, some have just moved on to other things. In any case, it is getting harder, not easier to obtain tower space.

>Maybe there could be some kind of emergency
>justification for this. You know, as, say, local governments become
>more and more dependent on landline tcp/ip, perhaps there'd be
>a rational for building an ham radio based network. Also, here in
>the SF bay area, there are lots of boats, and I was thinking
>maybe this kind of network would be useful to communicate to these
>guys.

There is cellular-based ISP service available in most large towns. Again, Ham-Web has nothing to do with tcpip.

Here's the official Ham-Web URL.. Download the software, then read the docs.

Thanks for reading this message.
I bought a few days the mfj9600b 9k6 modem
to work with my 1278b
I'm having some trouble to setup this modem and I think
this is because pin 1 and 2 are shorted. The manual says that after removing
the jumpers of the
20 pin header J4 of the 1278b mainboard , pin 1 and 2
should not be shorted,
and there's nothing about if they are. The DCD seems
not working.

Please if you have experience to setup this modem or any
suggestion drop me a line.

Sorry this poor english.

Thanks,

Hello

I uploaded FT-Manager V1.4, latest release of my Windows 95/NT software
optimized for Yaesu rigs (shareware).

FT-Manager V1.4 now supports :

YAESU FT-757/767/840/890/900/920/990/1000MP/D
Including : full real-time monitoring, Web cluster, Log-book, band scope,
Short Wave data base, rotator control ... and fixes...
To download at http://ourworld.compuserve.com/homepages/f6dex

I am waiting with impatience the Yaesu FT-847 and the ability to interface
PC & TX
at 56000 bauds ! (only 4800 bauds for other transceivers).

Soft990 MS-DOS SW (freeware) always available for
Yaesu FT-840/890/900/920/1000MP/D

I guess -- though don't you need a special exemption for doing automatic
transmissions on HF? Is it such a good idea to have a system, sitting on
an scarce HF channel pumping out data constantly? I don't know how well, this
is going to go over with the HF crowd. Err, maybe I do know, but I'll
leave it up to someone else to make the point.

Hmm, could be the way to go, then, would be to put a duplexer on a packet
node, and stick in on the same antenna as an existing repeater. Maybe put
together a complete kit, that clubs that run existing repeaters could use to add
high speed nodes on the same antenna -- provided the packet frequency was
far enough away from the repeater input and outputs.

Really, I suspect higher frequency and higher bandwidth is more appropriate for
a 'ham-web' type of system. Since the broadcaster is going to need a pretty
clear channel -- and that's only going to realistically happen at 420+. Maybe
at 900Mhz+ in the urban areas. Perhaps a compromise kind of site, such as
the top of a tall building or the top of a good size tower could get good
results at UHF. I'd guess, not from any real data, but just from my
personal ham radio experience, that the ham-web will get better results broadcasting
at 2 meters than you will at 80 Meters for the distances you're talking about.

You must have missed out on my article concerning HF multicast. The present HF forwarding net will actually benefit more than any other single group, if it turns out to be viable on HF. In any case, I will be testing the system, not trying to run an actual Ham-Web. I'll be seeing how it functions is a very basic sense. To realize Ham-Web's speed potential, you must have as great a number of client stations as possible. The more recipients, the efficiency you snag out of it. I will be working with just a few recieving stations, in order to discover just what Ham-Web will or won't do under what conditions on what frequencies. I'll be supervising the transmissions, which will not be running 'round the clock by any means. I know I certainly don't run 'round the clock.

After being tested for basic functionality, getting an STA or whatever to operate HF multicast will be a lot easier than it is now when it is essentially untried, particularly on HF. I believe some testing of Ham-Web on VHF/UHF has already been done, but I have never heard of it being tried on HF.

I think of two meters as giving you a 50 mile radius, under good conditions.
Of course it covers more than that, but not much. I don't know about your
location but here, I will have to wait until early morning to find a clear
bit of two-meters to work with for testing purposes. There is literally no
chance of setting up a real Ham-Web on two-meters here. I'd go for 440 MHz,
and maybe 9.6kb to keep it cheap 'n easy, but still a bit progressive. (If
my main interest were in applying Ham-Web on VHF/UHF.)

By using HF, you lose some speed by dropping to 300 baud, but you must
remember that multicast's efficiency, it's real "speed" is heavily dependent
upon the number and distribution (spread) of receiving stations. You
transmit at a lower baud rate, but you also cover a much larger geographical
area with HF. The number of receiving stations (per server station) goes up,
and the number of servers needed to cover that area goes down.

Don't get me wrong - I think that using Ham-Web as intended, on VHF/UHF is great. -- BUT I personally believe it may end up doing us more good on HF, and I'm willing to fool around with it a bit to see if it can be used there.

I'm utterly new to the Ham thing. So far, the only interest I have is digital modes and some localized FM repeaters. Thus far, I have a technican class license, lots of willingness to learn and no radio equipment at all. I have more interest in this stuff than money, thus the lack of radio gear. I was wondering if there were any groups around here that I could contact about setting up some digital networking stuff. I have lots of Internet and TCP/IP experience, so all I'm lacking is the experience in packet nets.

You wouldn't have a reference, email or article on this? Maybe for the cost of the equipment, a little advice from someone who'se done it, and a well thought out proposal to a local repeater club it'd be possible to put in a high speed link. Hmmm.

In south Texas, the work was done by the commercial outfit who owns the tower. From what I gather, the antenna at 1000 ft. (TV b'cast tower) carries a repeater, node, and some commercial applications as well - All on one antenna. Some guy rides up there on an elevator to service the stuff, from what I gather. Quite a ride, I'll bet!

Of course the land in south Texas is perfectly flat, and soaked in salt water. With the 1000 ft. tower, they get pretty good coverage down there, as you can imagine.

I've never seen hams "do it" with ham equipment but the principle is there, proven to work just fine.

I have never bought a duplexer.. I'd want to know how they compare to the price of another antenna and run of heliax. The heliax is so expensive, I'll bet there's an altitude above which the duplexer is cheaper, but below that point you would be better off to put up another antenna.

Source record: 24727

How feasible is it to pick up weather satellite data?
Unfortunately the only suitable radio I have is a scanner, so I
would be interested in the NOAA and Tiros birds, at about 137MHz.
What bandwidth do they use?
Modjitation method?
Data rate?
Protocol?
How much of a problem is Dopplar shift?
How much antenna gain would I need (please don't say a 10m dish...)

Thanks for your help,

--

As others have noted, there are a number of legal issues involved with
allowing a direct interconnection between a campus network and amateur
radio. That's your major problem. Technically, a moderately high speed link
is easy to do.

56 kb is basically plug and play using the WA4DSY RF modem from
Paccomm, and an off the shelf transverter. From what we're seeing
with the Slovenian 1.2 Mb radios, they're build and play. They don't
seem to be the least bit finicky to get to work.

But neither approach is particularly cheap. A 56 kb setup is going to run
you $600 or more (depending on whether you can find a used transverter
or not) to buy off the shelf. The Slovenian radios will only cost about $200
in boards and parts, but there's a lot of labor involved in building them. And
a digital bit pump to feed them is a problem. The PacketTen can do it,
but that's $700 right there. So you'll wind up with over a kilobuck per
station for 1.2 Mb.

By contrast, a 9.6 kb setup is going to cost you at least $400, and a 1.2 kb
setup is going to cost at least $300. (Including radios in both cases.) Neither
is a very good deal when you cost them out on a per bit basis, though the
entry cost is lower.

HFbandwidth isn't all that scarce, besides Charles' proposal for
multicasting is likely to have to be done in the automatic digital segments
in the USA anyway. While HF packet wouldn't work, something similar
to one of the TOR modes with built in error correction and storage of
data so that things get compared might work rather well taking up 500 Hz
or so at best. It would at the least be an interesting experiment, and
something that might attract commercial attention or duplication if
implemented properly.

>
>

Charles, just where in the amateur rules is there any indication that
depriving a commercial ISP of revenue is a violation? A more telling
problem might be assuring that commercial transactions don't violate
the rules, but note that for example ordering a pizza from the web
over amateur radio would be legal as long as the individual ordering
was not employed by the pizza company or the pizza wasn't for
a commercial usage. I also note that for example setting up one
of the readily available software filters would eliminate most risk
of porn passing over the air.

Are you objecting because there will be a connection to landlines,
or because of the risks associated? I also note that perhaps only
offering the service with a control operator monitoring might do much
to reduce the risks you suggest too. Autopatch in the U.S. suffered
because all too many people were afraid to experiment. For a long
time for example it was illegal to rebroadcast the NOAA weather
stations directly, although one could broadcast the same info
if it derived over the telephone. At least twice that I know of resourceful
hams took a weather cube, matched the audio to a phone line, and
had the line answer putting out the audio from the weather cube. Not
only was it then legal but people got the same info that they would have
previously. What you're suggesting limiting access to the internet to is
the equivalent of the old weather radio rules. I can surf for days and
never see anything that I wouldn't want an innocent child or even a teenager
with overactive hormones to see, with things raising from raising wild rice
to national and international weather forecasts and the homepages of hams
who are often nice enough to offer freeware and advice on ham radio
issues.

I haven't been pricing this kind of equipment, but I've seen it come up
every once in awhile, and don't recall any scary numbers. In my mind, any

solution that involves plugging wires into little boxes is preferrable to climbing up a tower. Besides, it sounds like these sites charge for the antenna.

I hate to admit this in public, but I've run my 440Mhz
HT off of my 2m vertical and those other stations out there seem to hear me fine. Maybe it'd be as easy as finding a 2m repeater and then sticking a 440 or 222mhz node on the same antenna. With nothing more than a good filter on each radio. I'd work out the actual numbers for the filters first -- to avoid smoking the receivers.

Been doing this for sometime now.

Step one: get the 'Weather Satellite Handbook' (ARRL)
Step two: build the cheap crossed dipole antenna that's in there.

Now onto your questions:

Anybody can pick up the satellites, it's easy.
A scanner is a good start BUT the required bandwidth is about 40KHz.
This is way to wide for most scanners (which are 15KHz?), you need to
replace the filter on the scanner - for some scanners this is easy
on others it simply can't be done. This is the single biggest problem
to overcome - the scanner bandwidth.
They use an FM signal but it is modulated with a varying amplitude
signal (i.e. an FM signal with AM modulation).
You can demodulate the thing with a sound card and some free/shareware
programs available on the net - that at least gets you going.
I prefer a dedicated demodulator and software (I use MultiFax).
The 40khz bandwidth above takes into account dopler shift.
For the 137Mhz APT birds, you do not need a dish, just a crossed dipole,
eggbeater or a 2meter yagi on a az/el rotor will also work. For the
HRPT signal on the same birds you need a dish and a downconverter.

Like I said, just to get your feet wet, get the book, build the antenna
and see if you can get a suitable scanner. You need to be able to receive
137.5, 137.62 and 137.8. I think Hamtronics makes a sat receiver kit you
can build yourself. Run the audio output to your soundblaster card and
load up the software. Of course, you probably will need a sat. tracking
program to let you know when to do all this hi hi.

Have fun.

The amateur rules do not mention that issue at all. Still, a civil suit will shut you down just as quick as the FCC, if not faster. It's something to keep in mind.

You may be willing to bet your ticket on the infallability of filter software. Others might not.

>Are you objecting because there will be a connection to landlines,

I'm not objecting at all. I did, however, warn the new guy about a couple of ways he could easily get burned, and tried to give him an idea of what to look out for.

> I also note that perhaps only

Oh, God... Now we have to hear about how hooking up a modem to a LandLine is "experimentation" again...

I guess it, is for some of us... ;-)

Not at all. I suggested that the new guy try to stay out of trouble. Sorry if that bothers you, OM.

So? I can surf for hours and never see anything that ISN'T pornographic, if not illegal... The point is, any time you talk about Internet access over packet, you're talking about risking your ham ticket. After all the attempts I've seen to "hack" my packet BBS by hams over the years, I'm not buying any Mary Poppins routine about how a ham ticket guarantees decent behaviour. They'll do whatever they CAN do, and then go on to do a bit more. Count on it.

My guess is that any multicast system would be overrun by the
contester crowd every weekend :-). In order to have the system working
also on weekends, it has to be installed on a WARC band where
contesting is prohibited.

I don't know, but you may find that HF packet broadcasting might end up beingas
bad as normal HF packet. That is, it has proven to be quite a poor protocol
for the medium. Some of the other TOR modes, and Software modems being
designed, might be better.

But the problem there, is that HamWeb uses a KISS protocol to drive the TNC,
and that's probably not used internally with the TOR modes.

Naysayers keep in mind: Likely only a very few will have full internet access via my connection, in fact only two or three of my personal friends are likely to get it. But to be frank, I'm not making the ham radio data link for intenet access, that's just one of the myriad things that i could do with it. i don't even care if it wasn't included as long as i get to tinker and experiment.

I don't want to exclude internet access unless the university prohibits it. as
far as control operating and *personally* monitoring all activity through the
link - no problem. most of my hours will be spent cramped in my dorm, right
next to the radio equipment :)

Well, I may not have to foot the bill by myself, so as long as i don't go too much over $1k, i'll be alright. I think th real expense will be in providing multiple access "accounts", similar to an isp. especially if they're 56K. from what i understand, 10 simultaneous users = 10 computers(maybe)/radios/data cards/etc. the cost could go out of sight without lots of people to support it. of course 1200 or 9600 would be a bit cheaper, but not by much. PS, i'm not afraid to build anything but my experience is limited.

Oh, no. Realize you can run *packet* over the radio, so you can have
multiple connections with the same radio and computer at the same
time. Think of the radio link just the way you would an ethernet link.
Many computers can use the same link at the same time. Of course
they all have to *share* its capacity. As long as their usage is "bursty",
that works fine. If they all want simulaneous stream support, however,
they have to timeshare the available capacity. So if you have a 56 kb
channel and 6 users, each only gets about 9.6 kb effective throughput.
(Less actually, due to packet overhead and possible collisions on the
channel.) But because most access is bursty, each station will usually
have nearly the full 56 kb available during a given access.

If your computer is running Linux, you can setup multiple accounts
so that several users can be logged in at the same time over the
single radio channel. Linux can also act as a *router* to route packets
to and from the radio channel to and from an ethernet or a dialup
connection.

Charles people can file a spurious suit about lots of things. However
as long as the amateur's practices and equipment comply with amateur
rules, an ISP doesn't have much standing. I also suggest that removing
the case to federal court is always an option, and harassment suits don't
fly in federal court usually.
.....

They aren't valid. One can also restrict access to only certain IP addresses
if discussing the equivalent of access to the internet.

No, you told him not to experiment because he might get into trouble,
yet it might have been better to refer him to the rules and point out
which ones limit him and which don't. I don't suggest that you give
up your HF multi-casting concept you're pushing for example just
because some folks might find it problematic.

>>I can surf for days and

>Mary Poppins routine about how a ham ticket guarantees decent behaviour.
>They'll do whatever they CAN do, and then go on to do a bit more. Count on
>it.

Then aren't you conducting an experiment to see if someone can hack
your system by over the air rather by modem? Also, I have to be frank,
I don't look for porn, don't regularly see it, and don't go see what's new
in the porno world either in any usenet messages I see. Once again
though a trusted control op prevents many problems and also allows
access to more things for users. Technically by the way, your
packet station could have held a QSO with a bootlegger and violated
rules too. That fear doesn't stop you, nor does it stop most hams
on digital modes for long. Similarly your fears of possible suits seem
about as worrisome as a bootlegger getting on the air, and it's just
a big a violation to communicate with an unlicensed or unauthorized
station as it is to pass unsuitable material, with one exception, stopping
the passing of unsuitable material seems to have a built in defense
in part 97, namely discontinuing forwarding upon discovery.

Source record: 24747

The latest version is ADMS-1C or D. I have ADMS-1C for my FT-51R and it is great. Easy to use.

I travel a lot and I have several files, one for each direction and area into which I travel, as well as a local file. When I head for the NO VA - DC area, I load up the file for that route and area. With that file, the repeaters between here (Bristol, TN) and DC are in order -- first one in CH 1, second one in CH 2, etc. When I get back home, I load the local file.

You need a serial port. The software comes with a cable that plugs into the serial port and the radio.

Lee Mairs wrote:

At this point, it looks like HamWeb is the only terrestrial multicast
software available.

It's hard to say what setup would be best for HF. The Ham-Comm and soundcard
programs look pretty good for the client end. Servers might want to be able
to use a "TNC in a box" setup of some kind, so as to keep the demand on the
computer to a minimum. This is handy when trying to shoe-horn several
servers (BBS, Cluster, HamWeb) into the same computer. In that case, I'd
want to be able to utilize drivers written for FlexNet, since there is a
fair variety of them, with more on the way. (Including drivers for sound
card, BayCom, ect.)

My preference for the client setup is that it be very cheap 'n easy to set
up. Any old receiver should be good enough, even portables. The software
should work on any DOS PC. The hardware (if not a sound card) should be
Ham-Comm, or something a lot like it. I'd want to see versions for those of
us with better computers which would utilize DSP for better performance, and
have more bells 'n whistles.
Yeah, and I want a kit for under $100.00 bux which would include a receiver,
a Ham-Comm dongle, and software.

People in hell want snowballs, they say.

Yeah, regular old HF packet is not optimum, but for now that's what I have
to work with. If it works at all, I'll be happy at this point.

Note that the author of HamWeb included info in the docs to allow Client software to be written for the platform of your choice. DOS/Win/Win95/Linux/Mac/CBM (I assume the same info could be used to write a server. as well.) He describes it as a simplified version of the AMSAT multicast protocol.

Hello. My name is Ed/WA2HQA and I thank you for taking the time to
read this posting.
I currently connect to packet using a notebook computer and it works
well. However, it is bulky to travel with. Consequently, I was
considering a palmtop computer and the BP-2M which I already own.
My question is how does the TNC connect to the computer? Is there a
serial port and are special cables needed?
And, in your experience, which palmtop would be the beat choice?

Source record: 24751

I played with the software when it was first announced. Haven't messed with it much
since. One of the limitations I found, was that it would not work on a network
drive. This isn't a killer, just a minor annoyance. The way the software works is
only for use on a Win95/NT box, and you can't use remote drives.

I think probably VHF is the best for this application, as many of the HF protocols
are inherently multicast. That is, even RTTY is mostly a non-targeted broadcast.
The idea is to just get it into your computer automatically, and not have to
connect to a BBS.

Probably the biggest limitation as this idea goes forward, is the client end. Right
now the client requires a KISS TNC. Like the Weather services EMWIN
transmissions, a cheap little rs-232 adapter modem (baycom) should be the
target. Although some of those baycom style adapters are pretty pricey,
more so than an used TNC.

Actually, if cost is no object, you can purchase the EMWIN engine and
transmit BBS data instead of Weather data. The protocol there is a little
more sophisticated, in that it can interrupt at any block to transmit a
priority message, and then continue on with the previous block. I also
like the way it breaks up the satellite photos. That is, it will send some
photo data, but rather than just sticking to that until done, it will
cycle to some text data for awhile and then send some more blocks of
the photo. Since these are very large, it would take most of the
whole hour to transmit them.

Just some ideas...

Steve

Hello Ed, until someone comes out with a DOS shell for the palm-tops, your out of luck. The BP2 is just a modem, with all the TNC commands running from a software program. You can however, use a regular TNC with a palm-top. I do this now with a COMPAQ winCE unit, and the terminal program that comes with CE. You can get some really small (cigarette pack size) TNC's that run off of internal batteries, that make a nice portable setup. Most all of the winCE machines have a serial port on them, and come with the interface cable.

Can any one tell me what modems (9600 buad) are able to be used with
the PI2 Card, I have a Linux system running and just trying to see what hardware
can be used.

Thanks
Russell

I've got an HP 320LX palmtop, running WinCE, like most of them. I haven't tried it with a TNC, but it should be OK, as it has a standard RS-232 port, with built-in comms software. Mine works OK with AVR microcontrollers running with software UARTs.

WinCE has TCP/IP built-in, BTW, and uses it for communicating with a host PC.

What an excellent thing packet is!! It seems i read something about multiple
stations operating on the same freq. I will probably have a dedicated link as
well however, but now that i know it is not necessary i will have more

options.

i might add that there is no chance of an ISP suing me for lost business. No one has the right to tell me what i can do with my equipment and my internet connection as long as the law is satisfied that nothing questionable is going on. besides, how many people (who are the suing type) are even going to know i exist?

YAM110.MCS ? Try using YAM111.MCS, the setup file has been
updated : you'll get it directly from Nico's web pages.

Here Yam works fine. I've produced a kit version available for retail
and wrote a French (soon English) manual which explains how to build
it and how it works. More information can be found at
http://web.avo.net/infracom, in the english or french sections.

The HP95LX, HP100LX, and HP200LX should work just fine. They are
all DOS machines, so any DOS program that can fit in the TPA will run.
They have a RS-232 port. I've even run KA9Q TCP/IP on my HP95LX.

The newer WinCE machines won't run DOS programs (or regular
Windows programs either). They don't use an Intel CPU. They need
specially recompiled versions of Windows programs.

I was talking about the situation regarding a university computer. If you are using a normal ISP, no lawsuit is needed... You (the person supplying "freebee" E-Mail, Web access, ect.) will just lose your account and possibly have trouble obtaining another one. (Depends upon how big a jerk you've been.)

Your theory that commercial ISP's will not mind if your activities reduce their revenues may hold water in your imagination, but here on planet Earth I think you will find them to be less forgiving. Many of those companies are just hanging on, or are laying out cash to upgrade their systems. Very, very few of them will be happy with a customer who decides to "play ISP", ham radio or not. They have always frowned upon such activities in the past, and nothing has happened lately to change that situation. The larger outfits, by the way, didn't get that way by allowing their own customers to undercut them either.

Get real.

I say let up on the guy. Weren't you ever young? Doesn't everyone,
once in their life, take on a big, project for the hell of it?
If, with a few thousand bucks, a scope and soldering iron,
this guy can put make a system as capable as the local ISP --
well, that would be cool, wouldn't it? I say, go ahead and
try. If you get it working, put up web pages with diagrams about how
it all works, and pictures of your girlfriend or cats or something.
Put in a good faith effort to keep the traffic within ham radio
rules, and leave it at that.

If you really speak about Hi-Speed,
You have to take a complete different Form of modulation.
If you use QAM64 with Sin(x)/x shaped Pulses,
So you can have 64Kbit/sec on a band with 12,8 KHz Bandwith.

Thanks for the help, I will give the suggestions a bash.
My scanner is nothing fab, however I have identified the output from the FM decoder inside it, and observing a typical packet signal on a scope was highly revealing. The audio out connector produced a nice curvey triangular waveform with some dodgy crossings on it. The one from the FM chip inside produced a rather nice square wave, with just a little bit of noise. Clearly one is considerably easier to decode than the other. Schmitt trigger? Seems like a likely candidate to me. But non digital data wouldn't even need that. I assum the APT satellites do not use digital modulation, as one of the replies suggested, using FM modulation, then this signal consists of the raw analogue data, ie high amplitude = bright area, low amplitude = dark area? I assume this is what you mean.
Will give the antenna idea a shot.
I still haven't worked out the bandwidth of the FM output of the scanner, but since the packet waves I observed produced very square waves, I would assume that it gets perhaps upto the 5th harmonic, so has a bandwidth of order 15-20KHz. whilst this may be too low, I'm still going to try, you never know!
- Look what happened when they told Marconi that he couldn't possibly transmit over the Atlantic, and he tried anyway! (irrelevant aside, they've actually got the piece of morse ticket tape from that transmission on display at the IEEE headquarters at Savoy place in London!)

Any of the common G3RUH or K9NG modems will work. PacComm sells one,
TAPR sells one, etc. You'll have to make up a cable, and figure out a way to
power the modem (they are normally powered by the TNC in which they are
installed, but you aren't doing that so you need to supply external power).

If you were using the Gracilis card (PacketTwin available from PacComm),
the Kantronics 9600 baud daughter cards intended for the Data Engine will
plug right onto the Gracilis card. This makes a neat install, but you can use
that modem, or any other, with the PI2 by mounting it externally.

Ms Mataga, Thanks for the encouragement!

Mr. Brabham, there is not much difference from an isp admin that gives a free account to 10 or 15 of his friends and a poor college boy giving it to 5 or 6 of his friends. I'm sure my neighborhood ISP (one of them has offered to be a host to my operation!) would prefer if they got some money out of it. Realistically, no one will notice or care as long as the university administration is aloof. I plan on going ahead and doing it without asking permission. I am told that the internet use agreement (which i haven't read yet) doesn't require me to ask permission. I don't plan on causing any trouble so why call attention to myself? like i said "...poor college boy". No one will notice, at least I won't get any *bad* attention. I may impress my future Electrical Engineering professor though! I met him a few weeks ago to get a tour of the EE program at USU, he's a very genial fellow and i might add that he is a ham as well.

1600. hi-speed packet questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-26 00:00:00 UTC
From: qwasty@hotmail.com
Message-ID: <6febhh$32f$1@nnrp1.dejanews.com>
Source record: 24770

a few questions about what i've learned from my reading so far:

What is DFM and MSK? The PacComm site mentioned the different methods when refering to their modems. I understand AFSK and FSK, and i'm assuming that the different modulation methods are incompatible though i haven't seen it in print yet (i.e. you can't listen FM with an AM receiver).

Can a 56K modem using FSK connect with a 1.2K modem also using FSK? could I have multiple 1.2K connections to my 56K+? What is the most common/best modulation method?

OK, I guess I need some sort of data card for my computer: PI2, PackeTwin, PackeTen, etc. Then I need a modem: GRAPES for 56K or something else for faster speeds. What could I use for 2-10Mb/s? how about 100Mb/s? Then I need a radio/tranverter (depending on whether i use an RF modem or not). What is compatible with what? How about syncronous vs. asyncronous equipment? I've read all of N6GN's and the "Equipment Options" sites, it's mostly over my head at this point. I have gotten the impression that the PackeTen card is the most versatile, and that is what I should get if I want to experiment with various radios, modulation methods, and speeds. Could I use PackeTen for laser? Is PackeTen the fastest most widely used? Anyone want to clarify?

I am putting some commercial equipment on sites at about the 150' level in the Chicago area. I'm paying $500-600 per month for each site (single footprint w/ 2 antennas) and about the same for T1s. With all the PCS and paging stuff going in, the low sites are just as popular as the high ones. At $100 per month at the 12,000 foot level you would be getting quite a deal.

Sure. He's looking for the little 5-pin socket that connects to the radio-1 or radio-2 port on the back of the PK-232. They came with a cable connected. I have no idea where you would get one. Perhaps Timewave could supply the mfg and part number - I'm sure they acquired the PK-232 assembly drawings.

You *can* do that. But you either have to use a very well qualified
point to point path, or use training sequences. In either case, it
doesn't work well in an amateur packet environment. Due to the
need for full interoperability on a packet by packet basis, a
modulation with less elaborate requirements for equalization
is required for the simplex packet radio LAN.

Everyone talks about modifying a scanner to have a wider bandwidth - How about
starting with a radio that already has a wide bandwidth - say a common FM
broadcast receiver - and modify it to cover the desired frequency?

John :

You could just use the built-in terminal program to talk to your TNC via the serial port. You will however need a null modem adaptor added on to the serial cable that came with your 620LX.

Kantronics will also be selling a WinCE host mode program compatible with their controllers some time in 3Q98.

See the Kantronics web site at www.kantronics.com for more details on using the built-in terminal program and their WinCE host mode software.

Actually, the URL you want is not on Charles' site but located on TAPR.ORG

Visit the HamWeb page on the TAPR site.

http://www.tapr.org/~wa0ptv

Also, you can listen to John's talk about the design of the software and its
potential at the TAPR Virtual Meetings Page
http://www.tapr.org/tapr/html/virtual.html under the 1997 ARRL and TAPR Digital
Communications Conference (Session 1a - HamWeb: Rethinking Packet Radio).
Also, the paper John published at the conference can be found in the 1997
proceedings available from either TAPR or the ARRL.

When John told me two years ago he was working on this, I thought it was a
great concept. I had a similar concept when I spent a year at UoSAT, but just
never had the time to write the code while working on the PhD.

Check it out and play!

Cheers - Greg Jones, WD5IVD
TAPR

P.S. 1998 DCC will be in Chiacgo this year. We should have information
available shortly.

>Everyone talks about modifying a scanner to have a wider bandwidth - How about
>starting with a radio that already has a wide bandwidth - say a common FM
>broadcast receiver - and modify it to cover the desired frequency?

The problem with a FM broadcast receiver is that it has *too much* bandwidth
for a Wxsat transmission. That passes through more noise to the detector
and degrades the SNR. The discriminator is also optimized for the wider
deviation, and won't produce much output from the narrower Wxsat signal.
This further degrades SNR by requiring more post-detection amplification.

The receive bandwidth has to closely match the signal spectrum in order to
achieve proper performance. Using a broadcast receiver (with an ideal broadcast
FM IF filter), degrades SNR by 8.24 db. And that doesn't include the loss of SNR
due to the mismatched discriminator, which can be as much or more. Consumer
FM broadcast filters aren't ideal, so the SNR degradation is even worse.

OTOH, many older FM broadcast receivers had AFC, which can track doppler
(newer digitally synthesized broadcast receivers generally don't have AFC).
Most scanners do not have AFC either. So if you modify an older broadcast
receiver to tune the Wxsat range, *and* change the IF filter and discriminator
to work with the deviation used by the Wxsats, then you'd have something
useful. But that's *much* more work than just installing a wider filter in a
scanner.

>Visit the HamWeb page on the TAPR site.
>
> http://www.tapr.org/~wa0ptv

Is the original Ham-Web site. It's been around for a year or so. maybe
longer, but it hadn't been getting the attention it deserved.. I thought it
was about time a true paradigm shift were promoted, both on Internet and
Packet, so I have made an effort to promote both HF multicast and Ham-Web.

So far, a lot more hams on the packet net seem to be excited about it than
the ones here on Usenet. I've noticed the hams on the Internet talk about
different ways to do it someday, and the ones on Packet tend to talk about
how to do it now.

The docs to Ham-Web are really good. They are well worth downloading the
software for, whether you intend to run Ham-Web or not.

My article is concerned with HF multicast, which Ham-Web may be capable of,
though it is intended for use on VHF/UHF. (I hope it can be utilized at
300 baud. - Not sure yet!) Although I think the intended use of Ham-Web is
great, my real interest is in the potential of multicast on HF, where I
believe it's efficiency will have a much greater impact.

I intend to briefly experiment with Ham-Web, first on VHF, then at 300 baud on HF. It's the only terrestrial multicast system I know of for amateurs.

Recently I was told how getting older is hell, but still better than the alternative.
Sure, Ham-Web is not optimized for HF, but it's still better than the alternative!

Later, I'd hope to see multicast software usable with the Ham-Comm dongle (or soundcards) allowing utilization of a variety of software including DSP, and leaving room for experimentation with the multicast protocol.

DFM = Direct FM. This just means that you're directly
modulating the transmitter's oscillator. This is the most
widely used method for operating FSK at 9600-bps and
above.

MSK = Minimum Shift Keying. This is a form of FSK, in
which the frequency is being shifted by less than the
value of the baud rate. For instance, 3-kHz shift for
9600-bps is MSK.

>Can a 56K modem using FSK connect with a 1.2K modem also using FSK?
could I
>have multiple 1.2K connections to my 56K+?

No, but you can have multiple 56k connections with your
56k modem, and you can have multiple 1.2k connections
on your 1.2k modem. That's what's nice about radio, as
opposed to landline.

> What is the most common/best
>modulation method?

FSK/MSK is the most common. There's been alot of talk
in this ng about spread spectrum, but so far, I haven't
heard of any wide-scale ham networks using it.

DFM is Direct Frequency Modulation. A number of so-called FM radios don't actually use direct FM. They use PM (Phase Modulation), which is similar to pre-emphasized FM, but can't handle modulating frequencies near DC. In other words, it is fine for voice, but no good for NRZ baseband data.

MSK is Minimum Shift Keying. This is a special form of FSK which occupies minimum bandwidth by setting the shift to half the baud, and following it with *linear* amplification. This reduces the excess sidebands produced by ordinary FSK using a shift larger (or smaller) than half the baud. Use of a Class C amp following a MSK modulator will balloon the spectrum back up to that of ordinary FSK, so a linear amp is required. (There is another way, you can specially shape the baseband going to the modulator so that you can use Class C amplification, but that requires special waveshaping circuitry, and is best done in DSP.) What this means in practice is that you can't use ordinary FM radios to produce MSK. You need a RF modem.

>Can a 56K modem using FSK connect with a 1.2K modem also using FSK? could I
>have multiple 1.2K connections to my 56K+? What is the most common/best
>modulation method?

No. The modulations have to match for the modems to be able to interoperate. But thanks to the way packet time shares, you *can* have multiple 56 kb connections using the same modem. Aggregate throughput remains 56 kb, of course, but due to the bursty nature of most packet communications, that normally isn't an issue unless the channel is very heavily loaded.

As to which modulation method is *best*, that depends. Each method has its advantages. On a channel where packet by packet interoperability *and* maximum speed in a given bandwidth are required, MSK is the clear winner. On point to point dedicated channels, a M-ary modulation such as QAM, FDM, QPSK, etc, can get more throughput from the channel bandwidth (at a cost in SNR, and often at a requirement for training sequences). On a channel where equipment cost is primary, ordinary FSK via DFM is the winner. Only on a channel where you're limited to using only voice grade "FM" transceivers (which may not be DFM), is AFSK even a contender. Due to historical accident, however, it is the most popular. (The historical accident was the availability of large quantities of surplus Bell 202 modems at the time packet was started.)

>radios, modulation methods, and speeds. Could I use PackeTen for laser? Is
>PackeTen the fastest most widely used? Anyone want to clarify?

Ah, it isn't that simple. The PackeTen is a specialized (and very expensive)
card that supports up to 3 1.2 Mb data connections simultaneously, and/or
several lower speed ports. It uses embedded firmware to do the TCP/IP routing
function. This is both an advantage and a curse. It offloads the router function
from the host PC, but it limits you to the TCP/IP internetworking stack. (At
the lowest level, it can switch plain AX25 frames, but not as an intelligent
router.) It is not what you'd want for general purposes. This card can act
as a standalone hub in certain network topologies.

The Ottawa PI-2 card and the Gracilis PackeTwin are dual port data interface
cards. They are intended to take HDLC synchronous data streams, decode
the HDLC framing, and pass the data frames on to the host computer. The PI-2
card is half duplex DMA on one channel with its host (the other channel
has to operate interrupt per character). The PackeTwin is full duplex DMA
with its host. For most applications, the PI-2 is sufficient, and more cost
effective. All protocol activity is conducted in host software. These cards
are just HDLC bit pumps. (Synchronous modems, such as those used
for packet, all use HDLC framing of the bit stream.)

For asynchronous data applications (basically only RTTY in the amateur
world), a different sort of modem and bit pump would be used. Typically,
that would be a modem called a TU (Terminal Unit), and an ordinary PC
async serial port would perform the bit pump function.

At the really high speeds, 10 Mb to 100 Mb, none of these methods will
work. You need a dedicated chipset with full host DMA, like an ethernet
card, to do these speeds. That's all very experimental in the amateur
world at this time.

In general, there is no interoperability between the various different
digital techniques in amateur use. You have to have the right sort of
modem/radio (or RF modem) for each of the methods in use. As long
as the modems use synchronous HDLC bit streams at speeds below
128 kbps, the Ottawa PI-2 or the Gracilis PackeTwin will work as the
bit pump. If you're using the TCP/IP protocol stack at 1.2 Mbps, the
PackeTen can be used as a router or hub. Some experiments have
been done using adapted ethernet cards at 10 Mb. Above that speed,
you're very much on your own.

Lasers are typically operated with ASK (Amplitude Shift Keying).
That requires a different sort of modem. The bit pump required
depends on the speed of the keying. Lasers are outside of an

amateur radio context, so I'll say no more about them here.

>years. Zero connections. No requests for info, nothing.

With anything other than the default Bell 202 AFSK stuff, you *must*
interest a local group in adopting it. Just putting one up and expecting
the users to come won't work. It must always be a coordinated *group*
effort. Packet is inherently a collaborative effort. Lone wolf activity gets
nowhere.

I'd also note that 9.6 kb is generally a waste of effort. It is too fussy
to get to work properly through the various amateur voice grade FM
radios for the benefit received. Jumping directly to 19.2 kb FSK or
56 kb MSK with a proper RF modem makes much more sense. That
is *not* fussy. It is rock solid reliable, much more so than even 1.2 kb
through amateur voice radios with their tone twist and TxD issues.
And the speed improvement is dramatic.

But it *must* be a group effort from the very start. The best way to make
it go is to arrange a group purchase at the very beginning to ensure a
stable critical mass of users. GRAPES started with 50 units. That was
sufficient to establish sustained interest and support. A smaller number
may have worked, but when you get down to two or three it is unlikely
that you'll have a sustainable system unless those operators are
heroically dedicated.

>Get real.

Please do get real. Many ISPs have been supportive of having an experimental wireless adjunct to their systems. We've been offered free access accounts by several. They want to gain experience with wireless internetting before commercial wireless starts to become a reality. Wireless is different from wired, and mangement of wireless internetting is new to most ISPs. Allowing amateurs wireless access gives them a low cost test bed.

You need to have a plan, and approach the ISP up front about this. They do *not* take kindly to you attempting to sneak extra access from them. But many look with favor on a planned intertie. I know that collaboration, group effort, and planning are alien to most amateurs, but it is essential to good networks.

Now it is possible to access Internet via your Local Gateway station using
the thousands availble for WIN95 programs. IExplorer,Netscape etc. And is
Easy. No DOS drivers. Use AGW Packet Engine and you are ready. You can use
the follow tncs that AGW Packet Engine Supports
1.All external tncs with KISS mode (Dual port also)
2.DRSI cards (all of them up to 4 at the same time)
3.BAYCOM serial 1200/24000
4.BAYCOM USCC cards
5.YAM 9600 modem
6.OE5DXL 9600 G3RUH compatible modem (cheap about 10$USA)
7.Sound cards with the PSA chipset.

Check my web site for more details.
http://www.forthnet.gr/sv2agw/

That photo has been heavily retouched and "massaged", as a close examination of the graphic will reveal to knowledgeable digital photo meddlers. Actually, I am much fatter and uglier than the photo you saw on my web page would lead you to believe... Most of the more radical deformities have been carefully edited out, along with "Fred", the second head which depends from my left elbow.

Thank you for your interest.

>effort.

I was with you until I got to the "always" part. That indicates either narrow vision or lack of imagination, more often than not. A red flag indicating poor or incomplete thinking. Provincialism alert.

Fact is, "your way" may work just fine, but only a fool would imagine that it's the ONLY way, and must ALWAYS be followed. Yes, other ways exist, and you can be sure that at least one of them is better than the vision you have limited yourself to.

>Packet is inherently a collaborative effort. Lone wolf activity gets
>nowhere.

To some extent, of course, you are right. On the other hand, you choose not to believe in the existence of the amateur packet radio network, and this has had a detrimental effect on your ability to follow many of these issues.. Those of us who use the packet network every day know that a great majority of the network was indeed built and is still maintained by "Lone Wolf" types, who do not readily mix with the local clubs or groups..Instead of going "nowhere", the network these "Lone Wolves" built covers the globe, going many places where the Internet is still just something to read about.

I always applaud cooperative efforts, and am currently engaged in more than a few of them, just like everybody else. This does not limit me to them, however, and I do not have any problem with looking into things on my own. When I feel strongly that something needs to be done, I do not need the support or approval of my peers in order to move forward. If it's important to me and not to others, then the the responsibility rests on my shoulders, not on everyone else's. "All progress depends on the unreasonable man."

In fact, my 9.6kb port was an attempt to nullify the "There's no 9.6kb stations out there to talk to." arguement. It was not an attempt to do anything with the "network". It was a user access port. The network was already high-speed.

The TexNet high-speed network (the real; amateur radio part, anyway) was generally built one node at a time by individuals, and not as part of a group purchase. Texnet now covers several states, including large chunks of Texas, by the way.

>I'd also note that 9.6 kb is generally a waste of effort. It is too fussy

>that you'll have a sustainable system unless those operators are
>heroically dedicated.

Again, you appear to be confusing tcpip with amateur packet radio. Only tcpip requires the "critical mass" in order to be viable or useful. This limitation is not true of amateur packet radio, where even a two-station "lan" is a good start, and can reasonably be expected to sustain itself and grow. Your contention that a packet network "must" begin as a group effort only points out the inherent limitations in "your way". (tcpip)

At the risk of offending my esteemed supertech engineer Gary Coffman, I have to agree that "group efforts" are not the ONLY way to get high-speed or any other wireless data system going. I've had lots of fun communicating with myself (well, mobile to base, all my own stuff) running porta/mobile RTTY and packet. I am attracted to GRAPES equipment for similar reasons: To be able to stay connected to my own systems while away from "the shack". Being able to utilize a 56-kb or so system that would allow me to access internet and web stuff while away from the house but within radio range of my tower etc. is a tempting idea. Granted, wide area coverage requires group cooperation UNLESS one is wealthy and cash is not a concern.

Me, eventually I'd like to see digital HTs. Though I'm afraid even
56Kb isn't going to allow too many simultaneous conversations on a channel.
Even so, a few hundred miles of linked digital nodes could blow away any
conventional linked repeater system -- in flexibility. Also, the
Grapes cards are kind of large, aren't they? Plus you need the transverter and
the PC, which all need to be shrunken down a bit. Hmm, has anyone torn
apart a digital Cell phone? Are these guys SS?

9600 baud makes sense in some ways, I think, if you want to play with
Pacsats or something and have all the bits lying around anyway. For me,
I may pick up a data radio to try to hit the 9600 port at Stanford.
JNOS at 1200 baud is slower than you can possibly imagine something to
be and still work.

1643. Re: PCMCIA TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-29 00:00:00 UTC
From: Doctor Bob <bob@antispam.com>
Message-ID: <bQUcFLAQZsH1Ew2Q@bobshack.demon.co.uk>
Source record: 24625

Once upon a time while I was planning my next Las Vegas visit
<6fk6ci$lt2@q.seanet.com>, Bob Ashby <bashby@seanet.com> wrote,

What a great idea, But,,,,,

Where would you use a PCMCIA card? On a portable.
Why have a 'TNC'? To leave it on 24 hours a day, giving facilities of
nodes, APRS etc.

Therefore why have a 'TNC' on a portable?
Why not make it along the lines of a Baycom board?
This would keep the cost down, yet give you a full (portable) packet
station.

You could of course us it as a Hamcomm interface as well.

Why would I have to maul my KAM (or KPC-3) along with a PSU (or
batteries) as well as my radio and other gear, where as a lap-top and an
internal 'baycom modem' would be adequate?

Just my thoughts. (I prefer a real TNC over a modem.)

I just pick up a Tandy 1500hd. But for some reason I'm unable to get
Baycom 1.4 or 1.5 to
run on this laptop. In the manual it says it has a V20 running at 10mhz
but still it does not
REC or Xmit. I have in the passed had no problems with Baycom even on
4.77mhz XT's
Anyone have any Ideas ?

Thanks....de AL

I agree with that you and Gary have said the same thing! All Gary said was that you can not build it and expect that they will just come and follow your lead. You have to solicit hams and get them to spend money on your idea, otherwise you will be wasting your money and your time.

With this form of communication you can not always expect that people mean exactly and only exactly what they write. Charles basically called Gary a fool that lacked vision, and I believe none of these are true of Gary based on his previous postings. Charles if you want people to listen to you do not shut them down by making them defensive.

Rob Kling

1647. Re: common hi-speed packet

Newsgroup: rec.radio.amateur.digital.misc

Source record: 24716

Speeds less than 9 .6 kbps are acceptable for keyboard communications, and that's really what most Hams had in mind when the packet protocol was designed. Most had only the concept of RTTY QSO's to build upon.

The reason 9.6 kbps seems so slow, is the equipment it runs on. If you run 9.6 kbps on or through a netrom clone, ROSE, or the WW BBS net, you've basically taken a good speed and limited it by a poorly designed transport protocol.

X.25, the protocol ROSE emulates, is even crappy over telephone lines. I ran that in the 80's at 9600 telco full-duplex, and it was a poor performer in that application.

Take all that you know about packet and set it aside. Then take two stations and run JNOS between them. Set your MTU for some large value (I use 1500), your MSS to 1460, and TCP window to 1500 (stop and wait mode to listen for ACK better). Before all the local packet guys went back to netrom, I ran this between myself and kb0qj and we were impressed enough to send large files between ourselves. What did we learn from this experiment?

1. More than 2 nodes on an RF channel is deficient at 9.6 kbps. Don't get me wrong, 56 kbps can probably handle more nodes, but using only a max of two, will transport data faster, if that is your goal.
2. Netrom sucks.
3. Rose is better than netrom, but sucks.
4. small packets suck.
5. datagram mode is usable only on a non-shared channel. But connected mode running segmentation is superior to the crap most Hams run on 1.2 kbps.

True full-duplex is the way to go. There you can run a large TCP window, and the ACKs won't get obliterated by the source node. Repeaters are a close second. You can build a great 9.6kbps node using 4 Tekk radios (two to link in one direction, and two to link in the other). The object is, to transport packets across the prairie, not connect all the packet frequencies together.

That's the one thing I really hate about packet. There always is the tendency to relieve the operator from raising his arm and turning the channel. That is, the operator will leave his frequency alone, and use two other node frequencies to transport him to the frequency a couple kilohertz away! It's just a crock...

A system of full-duplex nodes, would basically wipe-out the
voice repeater technology. That is, digital voice could be
used for the backbone between repeaters. Voice quality is
actually pretty good using low baud vocoders, but outside
of emergency communications, probably not as enjoyable
as full-bandwidth audio. If voice is the objective, and not
computer data, then smaller packets would be better, as
you will use a lossy protocol. That is, there is no time to
repeat the packet, you just throw it away and suffer the
blip in the audio.

Cell Phones are going SS, but most are cheap little walkie-talkies
just like the ones you played with as a kid.

1648. For Sale: L.L. Grace "Satellite" TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-29 00:00:00 UTC
From: Dale Yost <dyost@marketing-support.com>
Message-ID: <351E6E9B.312F@marketing-support.com>
Source record: 24717

Hi,

FOR SALE: For ham radio enthusiasts, this is the "ultimate" TNC. Hook this up to your rig (even a handie-talkie!) and your IBM-compatible computer and you can easily connect to your favorite local land-based packet radio stations. But this TNC can also let you do a whole lot more--including experiencing the thrill of communicating with any of the many amateur radio satellites, certain (ham operator on-board) Space Shuttle Missions, even Russia's MIR
space station!

The DSP-12 replaces the traditional analog modems of cheap TNCs with a Digital Signal Processor (DSP) CPU! It's fully programmable.
Handles the specialized packet protocols of WEFAX, RTTY, ACARS, plus the OSCAR (Orbiting Satellites Carrying Amateur Radio) satellites. Works
with
HF Packet, RTTY, and ASCII; VHF/UHF packet; plus the capabilities you need to work the satellites: 400-bps PSK, 1200-bps PSK, 9600-bps direct FSK--plus six PSK speeds from 75-1200-bps. And since it has a computer CPU, it can be programmed with software upgrades to handle new technologies/protocols as they're introduced.

This immaculate unit cost me over $700 new. Comes with a very thorough manual--plus Satellite Tracking software (Looks better than NASA's on-screen), plus cable to connect to your computer's serial port, and TNC software. For best offer over $350, I'll include a power supply unit and books on satellite communications to get you going.

> alone, and use two other node frequencies to transport him to the
> frequency a couple kilohertz away! It's just a crock...

Frequency control should be under the control of the computer attached to the radio, and frequency diversity should be used to increase system bandwidth in all areas. There are networking and routing research issues here.

P.S. (for home to home networking):

I'm interested in building a very high-speed packet network, but only on the microwave bands where bandwidth is available, and only at speeds meeting or exceeding 1.2 Mbps. Even 384 kbps or 512 kbps would be too slow --- because the telcos will be there very soon.

Cable TV companies will be selling 2-10 Mbps internet access all across the country in a year or two. When packet started, we beat available telco bandwidth by a factor of at least 10. If packet doesn't do the same, there will never be any real interest.

P.S. (for mobile networking):

There is now a consortium of companies deciding on mobile connectivity issues and standards. We have to beat them as well. They seem to be settling for 19.2 kbps connectivity. (Here, 56 kbps would be very good and worthwhile!)

I wonder what *real* applications there are for amateur radio digital mobile. You can't surf the internet while driving down the road bouncing off the other cars. One of the nice things about email (as opposed to the telephone) is that it is fast and immediate but not interrupting and intrusive. It waits for you. How much amateur radio email is so important that it is worth spending big-$ in order to get it a few minutes earlier when you stop in some parking lot? What need is there for transporting files to or from a car?

Note that I am not considering most emergency operation here. It either requires low bandwidth, in which case it is better served by voice communications, or a small tower with attached microwave antenna can be errected at the site where high-bandwidth emergency communications are needed --- much like the TV stations do.) To me, it just doesn't seem like there is a huge need for high-bandwidth mobile data communications (for amateur radio or for anybody else). If I'm wrong, tell me how and

why.

P.S. (for multi-casting):

What other applications are there other than bulletins, a DX cluster, and other special interest programs such as "This Week In Amateur Radio", "Newsline", and the like? Multicasting would be great for these applications, and *should* be done. In fact, it already *is* being done! (That's what the DX cluster basically is.) It should be enhanced in bandwidth to be able to carry high-quality audio at real-time speeds.

In addition, digital HDTV multi-casting should be done on low microwave frequencies in order to cover items of interest to the amateur radio community, such as club meetings, legislative governmental meetings where antenna restrictions are being discussed, and the like. (Perhaps ordinary NTSC would be better because it is much cheaper and the receiving equipment is already out there.) Is this already being done? I haven't seen it.

Conclusion:

If I'm right about this (that there aren't many applications for high-bandwidth mobile data), then we should be spending our efforts to build a high-bandwidth point-to-point amateur radio data network.

On my original post, I mentioned a PCMCIA TNC. What I am really
interested in is a decoder with the capabilities of the HOKA-3 or other
DSP decoders.

> blip in the audio.

Yes, maybe voice is the killer app for this kind of technology.
There are large repeater networks built already, and it's
the kind of thing that fits in well with existing ham radio
practices. And, the network could serve people
who are club members at existing analog repeaters, by connecting
them digitally to distant repeaters. It'd make the linked
systems more user friendly, since you could talk to a distant
system, without qrm-ing the whole network. And the network
could support multiple independent conversations between
repeaters up and down the backbone. And, on top of that
the same network could be used for packet and digital stuff.

Supporting voice, is also important, politically, ham radio wise,
I think, since it pulls in more potential supporters of the system.
That's the key, I think, to getting these kind of things going.
Show that there's benefit to the guys who just have an HT. If
we had a network, there'd more people to talk to on 2m. Imagine,
ssy, regionwide voice roundtables with topics -- where people
across the state with special interests could talk about, say,
their motorcycles or something.

An HP200LX (current model) palmtop or an HP100LX (obsolete, available used) will run DOS programs, including the software required to run a Baycomm (sp?).

If you're running Windows 95, you should give PacTerm '98 a try. It's 32 bit and runs with Windows 95, Windows 98, and Windows NT.

The demo mode of PacTerm 98 allows use of VHF Packet mode (radio port one, each stream in a different windows) for the life of the program with no charge and no time out.

It's at http://www.cssincorp.com/pacterm.

If you're using Windows 3.1, or 3.11 then Stan's program KA-WIN is your best best. For DOS only, KA-GOLD.

Yes, you can setup a system for your own use. As long as that serves
a need you have for internal communications, you may go to the trouble
and expense to keep it working. But most amateurs want to communicate
with others. And that requires a team approach. All of you must be able to
interoperate. At moderate to high speeds that means all of you must agree
on the type of equipment you'll use, the topology of the system, and the
types of protocols you'll run over it. And that means you have to work
together as a group.

Such a system becomes sustainable when the group is large enough
that the system won't be disrupted if a few of you move away or change
interests. Two or three people generally isn't enough. And for a system
to be useful to a group, it needs to be planned. Just having it grow like
Topsy generally results in a very unstable and short lived network. There
are many examples of that throughout the country.

There is an engineering maxim that "prior planning prevents piss poor
performance." That applies very much to amateur packet networks.
There is a synergy between all the various factors making up a successful
network. No one of them alone will make a network viable. It takes a
careful blending of all the various factors to achieve that. And one of the
most critical factors is teamwork and the group dynamics which makes
that possible.

That isn't what the packet pioneers had in mind. Their idea was to allow
computers to talk to other computers (to serve some human purpose
of course). RITTY, and its newer varients, is still the better way to do
most keyboard to keyboard QSOs. What makes packet special is that it
is designed to let machines intercommunicate in a *network*.

It's true that most packet users don't seem to appreciate that, and use
packet the way that they would RITTY. But that's only the most trivial
use to which packet can be put. Most of the real power and usefulness
of packet lies in direct machine to machine interaction across the
network. The most basic, and most used, such interaction is email.
But many other sorts of machine collaboration are also possible.
One of those that I find very useful is whiteboard conferencing.

>Take all that you know about packet and set it aside. Then take two

> your goal.

Multiple hops in a store and forward network increases latency
dramatically. This is a geometric progression, and becomes killer
if you depend on end to end acknowledgements with a go back N
stop and wait protocol. For large transfers, the answer to this
problem is to keep the pipeline full by not depending on go back
N or stop and wait. This requires a different network design than
you'd want for keyboarding.

>2. Netrom sucks.
>3. Rose is better than netrom, but sucks.
>4. small packets suck.
>5. datagram mode is usable only on a non-shared channel. But
> connected mode running segmentation is superior to the crap
> most Hams run on 1.2 kbps.

Datagrams with hop by hop acknowledgements and hop by hop
retries as needed at a lower protocol level is the robust approach.
Use of FEC and physical channel management can minize retries.
No retry should ever be required end to end except as an absolute
last resort. That's poor design in a store and forward network because
it maximizes the effect of the largest store and forward defect, huge
amounts of end to end latency.

Datagram routing should be dynamic, using a least cost metric
designed for the particular type of communications being done
at the moment. That allows datagram by datagram routing around
temporarily congested links or failed links. In a well connected
network, a single link failure or single congested link should not
be able to abort an end to end connection. This requires a dynamic
network supervisory and management protocol to be operative.

Netrom was an attempt at doing this. But the execution was poor,
and the topologies in which it has been installed are much too sparse
for it to operate properly.

>True full-duplex is the way to go. There you can run a large TCP
>window, and the ACKs won't get obliterated by the source node.

>node using 4 Tekk radios (two to link in one direction, and two
>to link in the other). The object is, to transport packets across
>the prairie, not connect all the packet frequencies together.

Duplex point to point links are useful in some circumstances.
But you might as well use a streaming protocol in that case.
Little of the benefit of packet is realized in such a rigid topology.

>That's the one thing I really hate about packet. There always is
>the tendency to relieve the operator from raising his arm and

If you have a real network, the operator *shouldn't* be messing with
layer 1 network topology. It is the network's responsibility to maintain
connectivity between all stations on the net. It can't do that properly
when the network topology is constantly being changed by the operators.
(Well, it can, but that requires really sophisticated network management
which is costly of network resources, and shouldn't be required except
in the mobile case.)

Yes indeed. Network topology should be under the network's control,
not left to the whim of the operator. That way the network doesn't
have to be constantly exploring itself to learn its current topology.
A network that doesn't know its topology can't do routing.

I agree to an extent. But there is something to be said for a network that
is under our control rather than being under the control of a commercial
network provider. That can be valuable enough to tolerate less than the
best throughput offered by the commercial providers. But the amateur
network shouldn't be such a slug that traffic volume dwindles away from
it to the competition. Then it wouldn't be very interesting or useful.

Look at the specs of the Motorola Cable modem, their uplink (783 Kb/s)
uses an RF frequency from 6 to 40 Mhz, might be a good start to build
a high speed packet link, with the motorola chips...
Then you might look at the downlink specs (30 Mb/s) for the next high
speed packet generation ;-)

Latency isn't a problem in a store and forward network (your typical
packet application). Latency isn't really a problem as a whole, RF
wise, because most Hams are used to delays in the area of 10's of
seconds (across a state). We worry far too much about latency, it
isn't that big of a problem, and the computers don't seem to mind.

> Datagrams with hop by hop acknowledgements and hop by hop
> retries as needed at a lower protocol level is the robust approach.

We call that connected mode. I was refering mostly to unacked
UI datagram. But what you say is correct. The worst thing that
can happen is waiting for the destination node to detect the problem.

I see packet as two topologies 1) the LAN, 2) the internet (not the
capital I internet). One (LAN) must be fast and reasonable. Nodes
on the LAN should mirror things people want from distant nodes via
the internet. The internet speed is not that important unless you
want any gomer to be able to reach any other gomer over it. In my
book, you just want mail and mirror tasks. Neither of which really
care about latency. Latency is a keyboard thing.

As usual you aren't listening, and just going on and on about something that while accurate, has nothing to do with the subject.

Let me put it in a smaller sentence and maybe you will stop and read it...

Most Amateur Packet Radio networks I have seen (and that's a lot, I do travel, and most operate this way) exist to network frequencies together. They are not designed to network communities. When they try to network communities, the task fails because all the bandwidth is consumed be the "channel network." Maybe yours is the only network in America that isn't built this way, but that's not relevant.

Steve

Radio Shack sells a little white plastic *thing* (I don't remember
what the technical term is). I think it is some kind of edge card
connector. But is has about 20 pins on it and I just cut it to
give me the 5 pins I needed for the 232, in fact I cut 2 for radios
1 and 2, the pin spacing is perfect. Only problem is I don't have
any kind of cover for it - it's plugged in there. Doesn't fall out
or anything but it doesn't really look all that great or provide
any strain relief on the wires.

>Everyone talks about modifying a scanner to have a wider bandwidth - How
about
>starting with a radio that already has a wide bandwidth - say a common FM
>broadcast receiver - and modify it to cover the desired frequency?

Indeed, that is what I did! I use a Sangean ATS803A (unmodified). The dirty work is done my a 'simple' masthead preamp & down-convertor, which shifts the band 137-138MHz to 95-96MHz using a 48MHz crystal. The success of such an arrangment very much depends on the local EMC environment. Nearby (strong) FM broadcast stations will cause problems. It works for me, and note that any broadcast FM radio may be used successfully. The side-effects caused by the extra radio bandwidth are: 1.insufficient selectivity, 2.the audio output is lower than normal.

Cheerio from Brian, on the Island of Malta.

Source record: 24640

Well, Gary, I'd be interested in your experiences with group/club efforts in GA vs. individual "lone wolf" operations.
Here in the West, our experience has been (with few exceptions such as the Upper Rio Grande VHF Society) that individually-owned nodes, digis, networks, and repeaters far outperform and outlast those supported by club efforts. In spite of the "synergy" supposedly available via group efforts there are also some problems with them (at least out this-a-way):
-Group politics that stifle new ideas
-Power struggles that alienate the technically-minded and other "doers" that would otherwise be available for support
-Slowness in response to outages, problems, etc, due to group dynamics and the need to "hold a meeting" to "discuss the problem"
-Group "meeting" dynamics that prevent "discussing the problem"
Every club I've visited or associated with invariably gets bogged down in arguments about who "was supposed to bring the donuts", "official business", and "guest speakers" much more often than anything actually related to radios or other technical issues related to what the club was supposedly originally formed for.
There are many systems such as wide area repeater linked systems, long range standalone repeaters, nodes, etc, "out here" that are individually owned and have been on the air 20 or more years with excellent performance and reliability records. Such things are rare indeed for club efforts. Some clubs have had repeaters on the air for maybe 20+ years but many of them have been off the air, unused due to neglected intermod problems, etc, (for some) more than half their lifetimes.
It seems that when an individual has a system up there is a much shorter response time when the system develops problems, goes off the air, etc. Clubs are slow to even implement such things as packet/data systems in the first place, and then seem slow to maintain/repair/improve them as well. One famous club repeater (unnamed, locals will recognize it easily) still uses a 1959 Motorola VHF tube repeater with the original wideband FM filter in the receiver, thus receiving (when it works) stations transmitting through other repeaters miles away but only 30-40 KHZ away in frequency.
This is NOT just my narrow-minded experience, it is a factor well noted by many from the Mississippi to the CA coast.
My "private" systems have NEVER been unavailable for general use; always open to the public in fact. That they often get little use (other than mine) is "Joe Ham's" choice. The other successful privately-supported systems I know of are not restricted from public use either. The ones who "stick to" basic voice repeater single-frequency operations or linked systems with mostly 2 Meter FM user inputs are usually quite popular with the ham public. It's when you set up a "new"

feature like remote DTMF control, frequency agile remotes, data linkups,
etc, that the majority of hams stay away.

:
: What a great idea, But,,,,,
:
: Where would you use a PCMCIA card? On a portable.
: Why have a 'TNC'? To leave it on 24 hours a day, giving facilities of
: nodes, APRS etc.

Not so, are you in a car 24 hrs a day? I think not. Some (more than half?) APRS users like to go moble with their setup and a laptop is perfect for the job. Add in a pcmcia card TNC that can have a gps engine hooked up to it and poof, not as much stuff flying around in the car at a sudden stop and not so many wires out in the open that can short or get pulled apart. Also, don't forget about us palmtop users. I have an HP 300LX that runs WinCE and has a pcmcia slot. I know Baycom's modem isn't compatible with my setup, but a regular TNC is!

: Therefore why have a 'TNC' on a portable?
: Why not make it along the lines of a Baycom board?
: This would keep the cost down, yet give you a full (portable) packet
: station.

See the above about WinCE. Also, a baycom relies on the storage space available in your laptop or palmtop. Again, being a palmtop user, there is little space to store messages if you also want to have other programs on it that you'd like to run. Build a little bit of memory into the pcmcia card TNC and poof there go your concerns about saving space for other programs.

: You could of course us it as a Hamcomm interface as well.
:
: Why would I have to maul my KAM (or KPC-3) along with a PSU (or
: batteries) as well as my radio and other gear, where as a lap-top and an
: internal 'baycom modem' would be adequate?
:
: Just my thoughts. (I prefer a real TNC over a modem.)

So why are you arguing that a Baycom modem would be better? Obviously if you prefer a TNC over a modem then you should support arguments for building a pcmcia card TNC instead. If a pcmcia card TNC existed you wouldn't have to worry about mauling your KAM or KPC-3 or hauling out a PSU (besides, why not use your car's battery for a power supply?)

These are my opinions.

I feel compelled to comment on this ... Ron Raikes, WA8DED, is a
personal friend of mine and I think he and Mike did a hell of a
job in improving on the "digipeater" kludge within the constraints
of the CPU (Z80) and the available memory space of the TNC-2.

While not the ultimate in networking, NETROM, with its hop-by-hop
acks and routing features was a BIG step up from what we had.

It's a damned shame the way hams treated Ron and Mike by using
the stolen copy "TheNet" which some Germans disassembled from
a single purchased NETROM PROM and reconstituted into what they
purported to be "an original work" ... which happened to be
line-for line identical to NETROM except for some artifacts of
the disassembly (like all parameters were passed in exactly the
reverse order because that's the way the disassembler sucked
them out of the image of Ron's code in the PROM they bought.)

It's too bad that hams are so damned cheap that they would rather
steal than to pay a lousy $25 to partially reimburse Ron and Mike
for the hundreds of hours they put into the effort and for the cost
of providing a pre-programmed PROM. (That's another thing that
really pisses me off and makes me sick about some hams.)

(Deleted)

First of all: Cut the marketroid crap. It's highly annoying. If you
want to play at being a sales-droid wanna-be, try a
biz.* group, or go to work for Microsoft.

Second of all: Get a clue. You managed to post to every Amateur Radio
group, with the glaring exceptions of the correct ones.
Does rec.radio.swap ring a bell? Do you REALLY think
that rec.radio.amateur.boatanchors is the proper forum
to sell a DSP controller? Try reading the USENET
charters.

Third: A quick search of DejaNews shows this controller being sold
used, with power supply, for less than $300.00. In 1996. By
several people. Again, get a clue.

Is that clear enough?

- Rich

What is TAPR up to? it doesn't seem like they're going anywhere, that's why i haven't joined yet. They don't place any emphasis on hi-speed. If we are going to get some activity in hi speed we need a dedicated organization to do it. does anyone know of any such groups i could join? I have little technical knowledge but i could pay a few bucks a year to support development. 1.2Kb/s is downright deplorable, (I laugh at ads describing their "hi-speed" 9600 modems. give me a break.) don't see much advantage in bothering with it when i could get many times the speed at 1/4th the cost from my local ISP! I've done a bit of research, explored the newsgroups, weighed the pros and cons, and i've decided to wait for my EE degree (and the $30,000/year that goes with it) before I attempt so much effort for such pitiful results. In the mean time i guess i will just the threads occasionally.

You can cry in your beer, or press on. Capitalism is a terrible disease, but
so far is still much more popular than Communism or Socialism.

Another good example was the Wright brothers against the world. Instead of

building airplanes, they designed one, and then tried to live off the royalties.
They sued everyone that they could find. Meanwhile Curtis built a better airplane and bought the Wright company (Curtis-Wright, even Curtis was first on the company name). Almost everyone includes theft of code in their business plan, and schedules a profit loss. Sometimes it even drives

them to encryption. Kantronics is a good example of a non-cloned TNC. Can't clone what you can't read (but profit is still impacted through copying I'm sure).

So, a Boeing 767 is basically based on a stolen idea from the Wright brothers. Should we stop buying stock, or not ride in them? Should Boeing use Wing-Warping instead of Curtis ailerons?

It's a damned shame how the people treat the Wright brothers by riding in planes that stole their aircraft roll design.

Should we throw away the X-1 chips and put in netrom chips?
Should we abandon use of IP features in X-1?

The best way to deal with theft is to have a second plan. Second plans are basic to Capitalism. When your original software is cloned, you deliver the improved version which offsets the profit loss.

Steve
P.S. The best course is to not run either X-1 or netrom clones (BPQ included here). The best course is to run something with memory in it. Dos, Windows, and Linux come to mind.

I'm running a bunch of KPC-3s in a remote-control system. One of them died yesterday -- the modem seems to have gone deaf. About 10-15% of packets get through OK, the rest are ignored. (the unit operates in KISS mode; when a packet is "ignored",. there is no RS-232 output, and the LED -- I forget which one is supposed to blink for a received packet in KISS mode, but it doesn't. FWIW in this application, this TNC never transmits, so I don't know if the transmit side of the modem is affected.

Replacing the TNC fixes the problem. But this isn't the first time I've seen this happen, and I've got about 6 more of these spread around the system. There really doesn't seem to be much in the modem that can drift, unless this 4.433MHz crystal is a problem? Has anyone else seen anything like this happen?

If you're aiming to make $30k/year as an EE, I suggest you consider
moving to some 3rd world country ... "fresh-outs" make more than
that here in the US if they're working for decent companies.

Hi,

Are there any commercial systems that allow locally created email messages
to be sent to the internet using an HF link (on a boat, for example)?

Anyone have contact addresses?

Thanks in advance,

Julian

Here's an interesting thought:

people pirate software because it costs 50 bucks. software companies charge 50 bucks because people pirate their software. people pirate software because it costs 50 bucks.

They have a Web page. Go read it.

> that's why i
> haven't joined yet.

I doubt it. You haven't joined because you spend your money on
other things. When you spend money on packet research and development,
then you will know what the groups are up to.

> They don't place any emphasis on hi-speed.

How do you know? Your first sentence claims you don't know what they
are up to?? Logically this doesn't follow.

> If we are going
> to get some activity in hi speed we need a dedicated organization to do it.

And someone else fund it.

> does anyone know of any such groups i could join?

Join your local packet club.

> I have little technical
> knowledge but i could pay a few bucks a year to support development.

Join TAPR, it's cheap, and they have a great bunch of engineers (hardware
and software) producing excellent kits.

> 1.2Kb/s

That nice. Sell your radios, buy a modem.

Well, if they just made something similar or compatible, that's
pretty much fair. But if their roms really have sections copied
-- that is way over the line, imo.

1694. List of the rec.radio newsgroups (brief)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6fs89d$67h@news.Hawaii.Edu>
Source record: 24664
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.digital.misc

In an effort help ensure a poster's article reaches the appropriate audience, below is a list of the rec.radio newsgroups. In most cases, a group's name will explain its purpose. Cross-posting should rarely be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-running thread results from a single cross-posted article, and the contents of such a thread drift further and further away from being "on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups" posted on the 15th of each month.

Jeffrey Herman (KH2PZ / KH6)
(rec.radio.amateur working-group)

1695. FT50RD and BAYPACK ??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-01 00:00:00 UTC
From: Mike Lamanna <mustang@kickit.pgh.net>
Message-ID: <3522D543.21EB2C2A@kickit.pgh.net>
Source record: 24665

Does anyone have any experiences with hooking up packet (Baypack and Baycom software) to a FT50RD ... I have the weird 4 conductor for the radio(from Yaesu) but I can not seem to get TX audio out???
Thank you

Mike WA3O

1696. Help with AEA CP-1

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-01 00:00:00 UTC
From: Powerless <pwentzel@minn.net>
Message-ID: <6fuqv9$17i$1@news.minn.net>
Source record: 24666

Can anyone tell me the correct RS232 jumper configuration to use the CP-1
with a PC?
Thanks and 73,
Paul K0PW

1697. FS: Yaesu FT-890AT & RS Pro-46 800MHz Scanner

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-01 00:00:00 UTC
From: "John G. Boehm, Jr." <jboehm@financier.com>
Message-ID: <3522D526.C19A7C3E@financier.com>
Source record: 24667

Hello and thanks for reading. I have the following for sale.

1.) Yaesu FT-890AT $700.00 OBO
100khz-30MHz Rx
160-10M Tx
I have all supplies including manuals for rig.

2.) Radio Shack Pro-46 Scanner $150.00 OBO
100 channel programmable Scanner.
Excellent little handheld scanner. Covers 29-54, 108-174,
406-512,
806-823.9375, 851-868.9375, and 896.1125-956 MHz.
Still have original packaging and user manual in good condition.

Scanner is in very good condition.

Any ?s or if interested e-mail me at jboehm@financier.com.

And there's the flaw in Carl's story. If the Germans had ACTUALLY done as he claims, I think it's reasonable to assume that after a decade or so, some PROOF would exist. -- Know what I mean? Where's the proof?

Judging by the strong feelings which have been associated with this issue for some time, and the alleged fortune which was lost on it's account (25 bux for every TheNet on the planet) it's strange that there has been no legal action - Unless the NetRom boys didn't really have a leg to stand on. That would tend to rule out legal action.

What we have to go by is a bunch of griping and complaining, with nothing concrete to back it up, either in evidence or action. (Yawn)

Of course you can take Carl's word for it, if you want to. For my part, I have yet to see any evidence of copying, and do not have sympathy for folks who complain for years but either have no evidence to back up their story or if they do, lack the stones to pursue and conclude the matter properly.

They'd rather just gripe, or they are full of farina. Take your pick.

The brown plastic part of the PK 232 connector is availble from Radio
Shack but it is about 20 pins long. One must cut that off and do a bit of
soldering to make it useful. Cliff K7RR

No big. With one of each chip it should be easy enough with a disassembler
to figure out if the TheNet is hot property. It's Z80-- right?

I don't have any personal experience with either one, (Due to this very controversy, I've avoided both and use BPQ instead.) but I believe you are right about them being for the Z-80. (TNC2)

In any event (copied or not) , the NetRom folks did not do themselves or their fellow hams any good by perpetually maintaining this tabloid-style controversy which has left a bad taste in the mouth of many an amateur over the years, without ever taking steps to resolve the matter.

"They'd rather just gripe, or they are full of farina. Take your pick."

My point is that it really doesn't matter if they were ripped off or not... If they were ripped off, they have since handled the problem in such an ignorant, destructive and self-destructive manner that I can only conclude that it served them right. If they are full of farina and were simply upstaged instead of ripped off, I would be less sympathetic and understanding about the bad feelings among hams they have maintained and encouraged to fester for years.

In either case, going on what I have seen and heard so far on this matter, I've discovered that my concern for the plight of the NetRom guys (ripped off or not) can only be measured in sub-micro give-a-hoots.

> -- that is way over the line, imo.

Cathryn,

The Germans ("NORDLINK") bought a single NETROM ROM, disassembled
it and reconstituted C source from that disassembly (the Z80 C
compiler didn't do any optimizations that were hard to figure out)
and then passed it out to the world as "their original work".

I was one of a number of folks who performed an evaluation, with
access to the original NETROM source code and the "NORDLINK"
source code.

EVERY routine in "TheNet" was an EXACT duplicate, line by line
with the original NETROM code, with the ONLY difference being
that ALL arguments were consistently passed in exactly the
reverse order. (This minor difference is believed to be an
artifact of the disassembly/decompilation tool used.)

Of several folks who evaluated the two source code sets, all
agreed that the liklihood of NORDLINK having independently written
"their" source was akin to the likelihood of a dozen monkeys
banging on typewriters producing a perfectly collated, letter-
perfect copy of the King James Bible or the unabridged dictionary.

The Germans were a bunch of f__ing thieves, plain and simple.
(excuse my allusion to strong language, but this issue still
pisses me off, in large part because hordes and hordes of US
hams were so ready to not only rip off Ron and Mike by using
and distributing "TheNet" instead of paying a lousy 25 bucks
for a legitimate copy of NETROM ... and to top it off, they
ridiculed and reviled Ron and Mike up one side and down the
other for crying "foul."

I hope this makes the facts perfectly clear.

Hardly a confidence-builder... On this list, for example, you devote most of your time to foul-mouthed griping and flame-baiting.. Were you like that back then too? If so, I would suspect you of manufacturing something to gripe about, if it wasn't already there.

>EVERY routine in "TheNet" was an EXACT duplicate, line by line
>with the original NETROM code, with the ONLY difference being
>that ALL arguments were consistently passed in exactly the

>artifact of the disassembly/decompilation tool used.)

If that were so, it would have been a simple matter to publish the two sets of code so all hams could judge for themselves. The fact that this did not occur - Not a confidence builder. We were stuck with only the word of individuals such as yourself. - Sorry, but that obviously was not good enough.

>Of several folks who evaluated the two source code sets, all
>agreed that the liklihood of NORDLINK having independently written
>"their" source was akin to the likelihood of a dozen monkeys
>banging on typewriters producing a perfectly collated, letter-

Almost all software written For Hams, By Hams is free, the effort being "donated" for the advancement of amateur packet radio.. My feeling is that if Ron 'n Mike had not been so intent on cashing in on their fellow hams, they would never have faced this particular problem.

$25 bux for each NetRom node ROM in the US, huh? Now, THAT'S a ripoff!

That might have something to do with the general lack of sympathy Ron 'n Mike experienced. I know it certainly did in my case.

Let's see.... Ron 'n Mike were out to put their hand into the pocket of every NodeOp in the US, then the Germans came along and offered something just as good for free.
Ain't that just awful.

>I hope this makes the facts perfectly clear.

Yes, we all know now what to expect if we try to cash in on our fellow hams. Somebody will offer other software just as good for free, and nobody will be sympathetic when we gripe about it. That's what makes the world go 'round.

Yes I am spending my money on other things, I'm going to Utah State University this fall so I have to put my equipment buying on hold for a while until I have a good idea of what my financial state will be. I may be able to get a good paying job where I can afford some extravagances, but most likely I'll have to wait.

I have read the TAPR site, particularly N6GN's material. Quite fascinating. Though i admit it's mostly over my head and I couldn't attempt to duplicate it without step by step instructions (I've been a ham for only about a year).

There isn't much mention of hi-speed packet, most info on the topic is not on the TAPR site. This leads me to believe that the largest packet oriented organization is not at the forefront of packet radio development. It seems that private individuals are taking up the hi-speed flag and TAPR is more concerned with the status quo.

I'd like to join a local club or two, but I've scanned 2M and 70 cm and I've never heard any packet activity before. I was told by another local ham that there used to be a local organization but they're no longer active.

Anyway, maybe that will give you a better idea of my position. Judging by the "temper" of your posting, you seem annoyed with my conclusion of the state of the packet radio art. Cut me some slack, I'm sure if I had more money, more elmers and some experience in electrical engineering, I would be more enthusiastic, but as it is it's way too expensive with poor results and as such it's out of my league.

I'm looking for the schematic for a KPC-2 TNC, to help debug some RF interference I'm getting out of it. If anyone has one that they'd be willing to photocopy for me, I'd be more than happy to reimburse them for their expense.
I've called Kantronics, and they said "buy the $30 manual," which seems a bit extreme, as i paid less than that for the TNC.
Any help appreciated. Thanks in advance. I can be reached at the email address below.

Making money isn't a crime. Copying someone else's work and giving
it away is a felony.

1710. PacComm DCD converter with KAM

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-02 00:00:00 UTC
From: ellis@stcloudstate.edu
Message-ID: <6g0vfc$t6d$1@Urvile.MSUS.EDU>
Source record: 24674

I am looking for anyone with experience interfacing a PacComm DCD
universal board to a Kantronics KAM (older model). I can't get it
to work open squelch (which is the point of the board). Another board,
designed especially for a PacComm Tiny 2 works OK with the Tiny 2. I believe
I have followed the directions properly.

Any hints?

Actually, Charles, I'm quite qualified to perform that evaluation, having
written tens of thousands of lines of C and C++ code to implement protocols
and simulate the performance of complex communications networks.

> >EVERY routine in "TheNet" was an EXACT duplicate, line by line

The TAPR BOD was presented with the evidence (both sets of source
code) at a TAPR Convention ... I was in the room at the time ...
they agreed that the code was identical ... so identical that "TheNet"
could ONLY be an outright copy/ripoff of NETROM.

They are software developers by profession ... they devoted many,
many hours (when they could have been working on paying projects
for clients) to develop NETROM. They had every right to charge
for the product. Their price was QUITE reasonable.

> $25 bux for each NetRom node ROM in the US, huh? Now, THAT'S a ripoff!

Typical cheapskate ham attitude ... You deserve everything for free,
right??? (not)

> That might have something to do with the general lack of sympathy Ron 'n
> Mike experienced. I know it certainly did in my case.

Yes Charles, but you're a well-known asshole, so your attitude
(condoning theft and trying to justify it) doesn't surprise me
in the least.

> Let's see.... Ron 'n Mike were out to put their hand into the pocket of
> every NodeOp in the US, then the Germans came along and offered something
> just as good for free.
> Ain't that just awful.

No, Ron and Mike were willing to give their work to every node op in
the US for about 10 cents on the dollar, counting the time they put in
and the value of their time. Yes, the Germans offered it to everyone
for free ... BUT IT WAS WHAT THEY STOLE FROM RON AND MIKE.

Don't forget the $25 cost included the PROM and the service of
programming it. I suppose you contend that Ron and Mike should
have bought and supplied the PROMs to everyone for free, too???

> >I hope this makes the facts perfectly clear.
>
>
> Yes, we all know now what to expect if we try to cash in on our fellow hams.

Do you bitch about buying a TNC? Should PACCOM and Kantronics be ridiculed and ripped off at will by folks just because they "try to cash in on their fellow hams"??? Would you think it was just fine if someone bought a single radio, say the new Yaesu FT-847, copied all of the PCBs, copied all of the firmware, and sold them cheaper (because they didn't have to recover the development cost)??? Or should this hypothetical thief of the FT-847 design buy the parts, build the radios, and then give them to you for free???

> Somebody will offer other software just as good for free, and nobody will be
> sympathetic when we gripe about it.

But the Germans didn't "offer *other* software just as good" ... they STOLE Ron and Mike's software, claimed it was their original work, and distributed it to assholes like you who thought it was just fine to traffic in stolen software.

> That's what makes the world go 'round.

Thievery is NOT "what makes the world go 'round" ... if the Germans had actually written something that was compatible with NETROM, or even better, that would have been fine. Ron and Mike would not have complained. (They did publish the complete behavioral spec for NETROM so others could build "compatibles.") But the Germans didn't do that, they simply stole NETROM, claimed it was "theirs," and de facto put it in the public domain without the permission of the legitimate authors/owners.

While I have no great love for Microsoft, for example, I would NOT suggest that it would be "just fine" if you were to start distributing pirated copies of Windows 95 and claiming that they were your oriiginal work. Nor would I suggest that you were a popular hero and that "Bill Gates just got what he deserved." (not that I like Bill that much, but the fact is still that he even though he's filthy rich he doesn't deserve to be robbed blind either.)

Another analogy would be for me to maintain that it would be perfectly fine for me to move into your house, change all the locks, and deny you the right to enjoy the benefits of the property. (Don't worry, I'm sure your place is such a shithole that I wouldn't let my dog piss in your front yard for fear he'd catch something.)

Charles, in summary, you're a piss-poor excuse for a human being.

Cathryn,

You're exactly right, but, unfortunately, there are hordes of jerks like
Charles in ham radio who think theft of software is "just fine."

The proof was presented to many and even the TAPR BOD agreed that it
was compelling. Just because you, Charles, jerk that you are, were
not personally given a dog and pony show doesn't mean anything.

> Judging by the strong feelings which have been associated with this issue

> That would tend to rule out legal action.

No, the problem is that Germany's laws on intellectual property are
different than ours and it would have cost a fortune to go to Germany
and sue the bastards there. It simply didn't make economic sense, but
that doesn't make what the Germans did right. Nothing could do that.

Anyway, it's not my battle, but I felt compelled to set the record
straight. I see no sense in arguing about it with the like of you
Charles. Face it, you like the outcome because being able to steal
the software saved you $25. What a (poor excuse for) a human being
you are.

> to figure out if the TheNet is hot property. It's Z80-- right?
>

I have not followed the history of "TheNet" in years Cathryn. It's
entirely possible that the Germans have re-written much of the code
(if it still exists today) and they may have made substantial additions
and improvements. It was clear that they were clever programmers from
the way they reconstituted C source from the disassembly of a NETROM
PROM.

As I said, I had personal posession of a copy of the NETROM source
for some time (I knew Ron Raikes, WA8DED) and compared it with the
"TheNet" source ... the ONLY difference in the code (a stack of
source listings over 1/2 and inch thick) was that the arguments
were consistently passed in reverse order in the "TheNet" source.
Otherwise the code was IDENTICAL, line by line and page by page.
There was NO doubt that it was a direct copy, not a shred of doubt.

This was publicised widely and people said "So what? Ham software
should be free. How DARE Ron and Mike try to charge for it? (even
though the charge was nominal considering the cost of the PROM,
programming the PROM, printed manuals, shipping, etc.) Huge numbers
of people condoned the theft, disseminated the pirated code, and
ridiculed Ron and Mike (as does Charles) for crying "foul."

Anyway, them's the facts and I'm not going to argue with a jerk
like Charles about it any more.

73,

Others may suggest various routes; I would suggest the ARRL books for
starters, and if you have Web access, check www.tapr.org for kits,
ideas, more books, excellent technical contacts, and share/freeware.
Joining TAPR can provide even more benefits. I'm fairly sure there
will be further contacts that will suggest themselves from there...
Good luck opening this new frontier!

Disassembly is a form of reverse engineering and as such it is
governed by laws in the US and in other countries. In many countries
it is legal to study a product, find out algorithms (such as a
protocol) and write a description what it does (but not how it does
it). Based on this description, you can then design your own
implementation (provided that the algorithm is not covered by a
patent etc.). Some US engineering society even wrote guide lines how
to do the reverse engineering process legally (basically have a
separate person do the studying and a separate person doing the
redesign with no contacts between these persons other than the
document _what_ the product does).

Also, in many countries, the common ban in software license agreements
against disassembly is void. Thus, there are strange wordings in the
disassembly clause in many software licenses to try to circumvent
this.

Claims that exact C-language copies are generated from disassembly of
an (E)PROM are simply ridiculous. Anyone who has done some disassembly
on any platform, knows that you can not make an exact reconstruction,
since a lot of information is missing (such as symbol names). However,
each compiler generates some kind of peculiar code sequences that
makes it quite easy to find out, which compiler was originally used.
Code produced from the C-language, is very hard to discompile exactly,
since the programmer might use pointer arithmetic or array indexing,
which both generate identical binary code.

The only way to get more or less identical C-code from a disassembly (apart from identifier names) is to have an identical C-compiler (same version and same settings) as the original and based upon the disassembled code, try to guess what the original C-code might have looked like and try to compile your guess on your own compiler. The produced binary code is compared to the original binary code and the C-code is tweaked until the produced binary code exactly matches the original (without correct identifier names). I have never ever heard of anyone using such an extremely time consuming techniques, when a much less identical result would be sufficient in most cases.

If such technique would have been used in this case, the parameters would have definitely been in the correct order.

If the source codes are identical as you claim (with correct identifier names etc.), then the original source code _must_ have been available and the reversal of parameters has been used to fool any binary comparison between EPROMs.

I have not seen either source code (nor either binary code) but as the story is presented in this newsgroup, something does not match.

There is a BIG difference from the "clean team" type of "make
an equivalent implementation" (like was done with the PC BIOS)
and making a direct copy of someone else's code and saying it
was your original work. That is what the NORDLINK group did.

> >As I said, I had personal posession of a copy of the NETROM source

That is a foolish statement. It can and has been done.
```

> Anyone who has done some disassembly
> on any platform, knows that you can not make an exact reconstruction,
> since a lot of information is missing (such as symbol names).

Obviously the identifiers were different, I was speaking of
lexically, functionally, structurally identical to the point
that it could NOT have possibly been coincidence.

The symbol names were similar, generally describing the function
that the routine performed, as I recall, but not exact. HOWEVER,
the functional code was IDENTICAL in EVERY respect with the lone
exception that all arguments were consistently passed in reverse
order. IOW, there were exactly the same number of routines,
with the same structure and functional code in each, and they were
all passed exactly the same number and types of parameters. The
code was identical in all respects except for the identifiers the
Germans could not have possibly reconstructed from information
contained in the PROM image.

That is definitely what the Germans did ... there were few C compilers
for the Z80 and the one used was the most commonly available. I believe
that the wrote an analyzer that looked at the disassembly and figured
out which C constructs were being represented. The compiler was pretty
simple as compilers go, so I don't think this was that difficult. I have
to admit that they were clever ... but that does not excuse their dishonesty
and thievery.

> If such technique would have been used in this case, the parameters
> would have definitely been in the correct order.

Why??? There is no logical reason to assert this ... the Germans
relied on the fact that there were a few small differences in the
binary image to persuade the ignorant that "their code was a different
and independently developed work."

> If the source codes are identical as you claim (with correct
> identifier names etc.), then the original source code _must_ have been
> available and the reversal of parameters has been used to fool any
> binary comparison between EPROMs.

The identifiers were, in fact, similar in that they were descriptive
of the function each routine performed, but they were obviously not
identical, since that information would not have been present in the
PROM.

> I have not seen either source code (nor either binary code) but as the
> story is presented in this newsgroup, something does not match.

You are mistaken. I was only one of quite a few who saw and evaluated
both sets of source code. The Germans ("NORDLINK") are a bunch of
thieving bastards I assure you and I would happily tell that to the
faces of any in the group involved, given the opportunity.

In other words, you have no experience with obtaining source code from an EPROM image (if it actually can be done), and have no qualification whatsoever to speak on that subject, much less make accusations. I'm glad you have cleared the air in the matter of your lack of qualification.

Took it to TAPR, huh? Everybody there solemnly nodded their heads in unison, exactly as if they knew what they were agreeing about, right? -- Hardly a confidence builder.

You could have gotten exactly the same reaction by taking it to the town drunk. (Especially if you offered him five bucks for "a cup of coffee" afterward.) He wouldn't have done anything about it either.

Aren't you glad you took it to TAPR, Carl? Yep, results talk and BS walks. All those heads bobbing up and down in agreement must have really been effective, somehow. (I guess.)

Then the alleged "evidence" just vaporized, right?

If they were professional software developers, why wasn't this handled in a professional manner?

Sure they had a right to charge for the "product", just as the Germans had the right NOT to charge for theirs.

Sorry, but if you want to have it taken as a given that the software was "stolen", you'll have to provide something more substantial than a lot of hot air and some bobbing heads at TAPR.

>> $25 bux for each NetRom node ROM in the US, huh? Now, THAT'S a rip-off!
>
>Typical cheapskate ham attitude ... You deserve everything for free,
>right??? (not)

"Deserves have nothing to do with it." So far as I've been able to determine, the authors of NETROM are the only hams in recorded history to attempt to charge their fellow hams for network software. In all other cases, it has been either freeware or careware. All other authors of packet networking software have been more interested in making a contribution to ham radio than they were in making a buck off of their fellow hams.

That might have something to do with the general lack of sympathy Ron 'n Mike experienced. I know it certainly did in my case.

Let's see.... Ron 'n Mike were out to put their hand into the pocket of every NodeOp in the US, then the Germans came along and offered something just as good for free.
Ain't that just awful.
>
>No, Ron and Mike were willing to give their work to every node op in
>the US for about 10 cents on the dollar, counting the time they put in
>and the value of their time. Yes, the Germans offered it to everyone
>for free ... BUT IT WAS WHAT THEY STOLE FROM RON AND MIKE.

That's easy to say... You still haven't proved a thing, except that you can blow a lot of hot air. Nothing new there.

>Don't forget the $25 cost included the PROM and the service of
>programming it. I suppose you contend that Ron and Mike should
>have bought and supplied the PROMs to everyone for free, too???

No, they should have freely distributed the EPROM image to other hams, just like everybody else has done.

Since they took it upon themselves to step beyond the pale and charge for network software, a lot of hams figured they got what they deserved when the Germans upstaged them. Thus the mysterious and inexplicable "lack of sympathy" from their fellow hams.

Why do you lump all Germans, and only parenthetically include
NordLink? Usually that means people don't have a suspect, so you
blame the whole race...

As they say: "Name five!"

Precisely. And right now, Cable Modems are FASTER than T1's in my area,
because hardly ANYONE has them, and there are NO regulations on how much
bandwidth you use. I can sometimes get as high as 200k/s late at night.
I'd like to see that over a standard T1. Furthermore, even though
cable modem costs are higher than your service ($40 per month vs your
roughly $8 a month), i'd MUCH rather have a cable modem, hence
discontinuing the need for a phone line and modem (phone charges are
about $12/month around here plus dial-up charges, which totals my
phone bill to about 30-40$).. so right there i'm spending MORE than
a cable modem. Also, by using your service, I have to 'share' the
bandwidth with other users, where-as with a cable modem I can milk
200k/s all to myself. Sorry, it's a nice idea for someone getting
into UNIX, the price isn't too bad considering you have no disk quotas
and so forth, but you're advertising in the wrong area and arguing the
wrong points.

The point he was making was, that you can utilize a news server anywhere.
You can have a dial-up account with ANY provider or have a cable modem, or
ANYTHING and be able to access a news server. There's hundreds of public
free news servers out there (they just don't have the alt.binaries.warez.*

and the porn groups).

In the last couple of pages of the manual for your radio there is a wiring diagram for packet operation. I would sure like to know where I can get one of the 4 conductor connectors. I'd bet newark or some other electronic supply company would have it. Even though it's non-standard, i'm glad yaesu used that type of connector instead of the bulky 2 connector jalopy.

Just a quick comment or two:

If I wanted hear insults I would be a CB'er. Please, Please keep it friendly.
I like to show my friends a bit of what's going on with Amateur Radio in the
news groups, I don't want them to get a negative impression.

Also, prolly should start a new thread with a new topic.

>> Claims that exact C-language copies are generated from disassembly of
>> an (E)PROM are simply ridiculous.
>
>That is a foolish statement. It can and has been done.

I have previously written several assemblers, linkers and also
disassemblers and I knew quite well what kind of code certain
compilers produced. It was quite easy to do some manual discompilation
based on the disassembly listing, but I would never claim that this
code would exactly match the original source code, even if the
discompiled source code would produce similar or identical results
when executed as the original code.

Defining the rules for an automatic pattern recognition/source code
writer to generate discompiled high level labguage would be even
harder.

Some simple languages with old compilers (such as FORTRAN II or
FORTRAN IV) are quite easy to quite accurately discompile manually and
also some toy compilers (such as compilers written by students as a
mid term assignment to write a compiler for a greatly simplified
computer language) produce quite predictable executable code and thus,
can quite accurately discompiled. However, in any complex language,
such as C, C++ or Pascal, it is very unlikely to be able to correctly
respond to all queer code generated by a compiler in a response to a
complex or in a strange way written program. If the compiler does some
optimizing (such as moving invariant calculations out of the loop) it
is even harder to generate an exact discompilation, even if the
discompiled program execution would produce the same results.

In fact the readability of a disassembled (or discompiled code) can be
much improved if the original code is available as a loadable image
(load address, start address, references to any system routines or
DLLs) or even better if the object files are available (global names
and external reference names).

>>
>> The only way to get more or less identical C-code from a disassembly

>and thievery.

If the intention was to produce a _functionally_ identical copy, then
why do the extra job to try to generate a source code, that when
compiled, would produce the same binary code ?

>
>> If such technique would have been used in this case, the parameters

>and independently developed work."

From purely technical point of view, (especially if both teams used
the same compiler) messing up with parameters in any stack based
languages (such as C or Pascal) is destined to cause a major havoc
very quickly, so a discompilation process would have produced the
parameters in the correct order.

I am just about as big a supporter of free software as you can imagine.
Without free software, I wouldn't be able to run a decent operating system
at home, have decent compilers, or be able to access the Internet. The
people who have chosen to donate their efforts for the benefit of all are
to be commended.

That being said, and having worked as a software professional for a decade
or so, let me say that writing software _is_ work. It's hard work. To
claim that someone doesn't deserve to get paid $25 for a program they wrote
is fine, but that DOESN'T GIVE YOU THE RIGHT TO STEAL IT. If you don't
want to pay the $25, try writing a replacement yourself. My guess is for
alot of things, that $25 will suddenly look pretty cheap.

>> $25 bux for each NetRom node ROM in the US, huh? Now, THAT'S a ripoff!

No, cloning it by changing the name and redistributing it is a ripoff.
If the software isn't worth $25, then DON'T USE IT.

>> Let's see.... Ron 'n Mike were out to put their hand into the pocket of
>> every NodeOp in the US, then the Germans came along and offered something
>> just as good for free.
>> Ain't that just awful.

The nodeops were under no compulsion to use their software, it happened to
be pretty good, and people liked it. The Germans didn't offer something
just as good for free, they stole it and redistributed it. That _is_
awful.

>> Yes, we all know now what to expect if we try to cash in on our fellow hams.

Frankly, if I could figure out how to make a buck by providing a valuable
asset to hams, I'd do it. Most sane hams would even thank me for it.

Well, that's not very nice! Those prospective hams have a right to know what they are getting into, and trying to paint a pretty picture now can only disappoint them when they find out the truth. Better that they find out now than later! In the long run, an accurate image is more useful to these folks than a "positive" or "negative" one.

Being honest and straightforward with prospective hams is the best deal you can hand them.

>Also, prolly should start a new thread with a new topic.

I'm kind of tapped out for new topics right now. I'm still getting my act together to try out the Multicast stuff, and until I have results to report, there's not much new I can say about it.

I'd like to know the current status of Tom Moulton and Brian Lantz's AX25 extensions for Q-bit support, if anybody's heard anything about it. Has it been tested yet? Can it be shoe-horned into a TNC2 EPROM without sacrificing too many bells 'n whistles?

Q-Bit was originally worked out to give packet nodes a way to communicate with each other, if I understand correctly, so that negotiation for full-time data compression and intelligent routing ala' FlexNet would be possible with existing equipment (TNC2) on the existing network, simply through swapping EPROMs in the node TNC's. The last I heard, Tom was going to try it out with ROSE. --- And that was the last I heard...

Here's the relevant URL's:

http://www.rats.org/rose/qbit.html AX25 Extensions for Q-Bit Support -

This paper by Thomas A. Moulton, W2VY and Brian Lantz, KO4KS describes extensions to the AX.25 protocol that will provide a technique for sending Q bit data which will allow for a standard method for signaling Network or TNC messages independent of the application that is using the connection. It can also provide a technique to negotiate additional capabilities such as compression.

http://www.rats.org/rose/ax29.html AX.29 Protocol Specification (Q-Bit Data)

This paper by Thomas A. Moulton, W2VY and Brian Lantz, KO4KS defines an extendible format for Q bit data which references other documents that will define the upper layer protocols, such as Compression Negotiation.

From: Tandy Way <tandyway@gte.net>
Message-ID: <6g3m2hplu1@gte1.gte.net>
Source record: 24602

I have a pk232mbx and I am using it in the host mode so my software does not matter in this discussion. however when I go in to rtty mode and try transmitting the mark signal does not stay on the air. it drops off after maybe half a second sor so. as long as I keep typing the signal remains on the air but if i pause to think about something the signal drops off and this must drive the receiving station nuts. doesn't matter about diddle on or off when there is no text to go out the carier drops. I am thinking this has to be caused by some firm ware value being set wrong. any owners of this unit have any ideas how I can make the rtty signal stay on the air until I press the ctrld to return to receive mode. this is only in rtty mode. pactor amtor cw work fine.
please answer via email as I might not see your response here with the volume of traffic.
regards
tandy K4YSN

> that it could NOT have possibly been coincidence.

Have you seen the two source codes?I have.
No disassembly was involved.
The source was copied.

There were some very unusual idoms used in both versions of the C code.
It seemed improbable two people would use these unusual idioms.
Thus it seemed probable that either one code was a copy of the
other, or both were copies of some third source.

My sole suggestion to the S-2000 crew was to immediately release
improved versions of the code, with some non-obvious protocol
change, and then to rapidly release a continuing stream of upgrades.

Of course it had already become clear that hams were not going to
purchase very many of the ROMs. NORDLINK was not the only cloner.

Another group created a small program which would patch the appropriate
things in a copy of the EPROM, and distributed patched EPROMS
to anyone who wanted one. In fact many of those patched EPROMS
are still on air in Northern California.

And those identifiers were also identical in both copies of the code.
In fact the German comments were a literal translation of the English
comments (or vice versa, there was no way to tell which came first).

It is not possible to determine "which C constructs were being represented".
The evidence in the source codes was quite clear:, because of the unusual
C language idioms used in both versions.

> > If such technique would have been used in this case, the parameters

Perhaps it was. Perhaps they obtained a copy of the S-2000 sources.Perhaps
S-2000 obtained a copy of the NORDLINK sources. Perhaps
both parties obtained the code from a common 3rd party. We will
never know.

> > If the source codes are identical as you claim (with correct

They were identical, except for the obvious translation of some identfiers
from Gernan to English (or vice versa). The main point I saw was the unusual

idiom for intializers within for () or while () blocks. The idiom used was very uncommon outside a small group of unix programmers. The idiom was used consistently and identically in both codes.

> faces of any in the group involved, given the opportunity.

And how was it you determined that the NORDLINK code was derivative?
Want to bet the farm on your conclusion?
I wouldn't ... but was willing to testify that the codes were in fact the same.
There was no evidence to show which derived from which, or to show that
both were not derived from some 3rd source. There simply was no legal case.

What ever happened to the dual port digipeater code?
Where did the first cut at the NNC code go?
Where did the initial code for TEXNET come from?

All this stuff is lurking about in my packet software archive someplace.
Perhaps someday I'll run across it all and post the lot of it here, so
that everyone can argue about the details of who did what to whom
15 years ago. Myself ... I'd rather get on with building a radio network ...

P.S.

If you want to call some group "Theiving bastards" best you have your facts
all in line in case they decide they don't LIKE what you called them. The case
is nowhere near as clear as you make it. If it WAS so obvious, then S-2000
might still be selling EPROMS ...

Total nonesense.
Diassasmblers do not recreate the comments!

The comments were intact in both codes ... solid proof that the
sources were copied and that disassembly (or other reverse
engineering) was not involved.

What S-2000 failed to provide was evidence that their source
existed PRIOR to the NORDLINK source. Thus no legal case.

Your accusation has not been proven.
From the evidnce at hand at the time ... it is also possible S-2000 stole
NORDLINK's work.

> > That's what makes the world go 'round.

>really pisses me off and makes me sick about some hams.)

Well, if the chip was only $25, you might have a point. I paid $70
for my NetRom chip. There was little or no support, and the callsign
was hardcoded into the damn chip, so you couldn't even change the node
identifier if you wanted to make a change.

Now, I didn't consider that price to be too high for ONE chip, given
that it included a very nice manual. However, there was hardly any
discount offered for upgrades or for additional chips. So if you
wanted to set up a multi-node stack or a network, you pretty much had
to pay full price for every chip.

As for stealing from NetRom by using TheNet, that's a pretty harsh
assessment. I followed the heated discussion of the issue on packet
during that time, and there were equally compelling arguments on both
sides. I don't think it was up to the average ham to decide who was
right. If the Germans stole the code, then NetRom should have gone
after them, rather than whining about cheapskate hams.

The fact is that _if_ the NetRom folks had improved and supported
their code and sold it at a reasonable price, I think many of us would
have continued to purchase chips from them. To the best of my
recollection, the only changes they made to the NetRom code after

TheNet came out was some kludge that made it difficult or impossible to interconnect between a NetRom and TheNet system.

Given the price of EPROMS at that time, and the hassle of getting them coded, I don't think that $25 would have been all that bad, especially if we could have gotten a discount for multiple chips and for upgrades. As far as I know, NetRom was never offered for as little as $25. If it was, they never bothered to notify me, as a customer, about this price.

As I see it, the NetRom folks tried to rip off hams, not the other way around. If they'd continued to improve the product and sell it at a reasonable price, hams would have supported them, IMO. Sure, some would have gone to TheNet, but if NetRom had offered a superior product, they'd have been a success. Too bad they didn't understand market economics. I have no pity for them at all, and I certainly have no guilt over using TheNet for our system. Besides, I used G8BPQ for my BBS nodes, and everybody agrees that it was not stolen from NetRom.

$70 was hardly "nominal," considering that there was little discount
for purchasing multiple chips or upgrades.

I ripped off nobody by using TheNet. I paid for a NetRom chip, and it
was $70, not $25, as I explained earlier. If it actually had been
$25, maybe there wouldn't have been such a rush to TheNet.

>I hope this makes the facts perfectly clear.

If you can't even get the price of the chip right, why should we trust
the rest of your "facts."

Good question. In fact, it seems that the NetRom folks were using the
ham program to develop and support a commercial version. That didn't
help them when the battle erupted.

>Sure they had a right to charge for the "product", just as the Germans had

>just as good for free.
>Ain't that just awful.

By the time the real node explosion hit, NetRom was defunct. So most
of the hams who installed TheNet didn't even have the option of buying
a NetRom chip. Besides, by then THeNet had been improved so much that
it would have been silly to pay an inflated price for outdated code.

>>Don't forget the $25 cost included the PROM and the service of
>>programming it. I suppose you contend that Ron and Mike should
>>have bought and supplied the PROMs to everyone for free, too???

They should have offered a product at a price that reflected its real value. $25 dollars for an improved and supported version of NetRom might have been a decent value. Too bad they didn't offer that.

>What S-2000 failed to provide was evidence that their source
>existed PRIOR to the NORDLINK source. Thus no legal case.

I think the chronology makes the issue of priority quite clear.
NETROM came first. The TheNet code was introduced later
with the claim that it was an independently developed fully
compatible clone of NETROM. That's what the TheNet folks
said. They made no claim of priority, rather they acknowledged
that theirs was a (legitimate they said) derivative effort. If it had
been their original work that had been ripped off by Software
2000, they wouldn't have made that claim.

The very exact similarity of the source codes makes the idea
of a legitimate cloning effort absurd. And it casts grave doubts
on the idea of reverse engineering from a disassembled binary.
I too am convinced that the virtually word for word duplication
of comments in the two sources makes that so unlikely as to
be totally discountable. I think it is clear that what happened in
this case was industrial espionage.

What I don't know is how that occurred. Either Software 2000
was very careless with its proprietary information, or the Germans
hacked their development system. Given the era, the latter is unlikely
because most computers weren't networked and physical access to
the machine would have been required. My very strong suspicion is
that a copy of the source found its way to the Germans after one of
the principals of Software 2000 showed it to some third party without
enforcing non-disclosure. (I know that there were rumors that copies
of the NETROM source were circulating in the amateur community
before TheNet appeared.)

I think what the TheNet folks did was unethical, but it may not have been illegal if Software 2000 failed to practice due diligence in protecting their proprietary information. To the best of my understanding, Software 2000 only copyrighted the binary image. They held the source as proprietary, IE a trade secret. (Software copyright law was somewhat different then than it is now, and they'd have to have published their source to secure copyright protection for it.)

Trade secrets aren't protected if their owners don't practice due diligence in securing them. I think that the claim that the TheNet code was obtained by disassembly of a NETROM binary is just a smokescreen to hide the fact that Software 2000 was careless with its proprietary source code.

But that aside, the attitude of the amateur community over this issue was very disappointing. Too many hams were willing to run up the Jolly Roger and condone this ripoff. Most people seem to realize that one can't just make a carbon copy of commercial hardware and represent it as your own product. But they seem quite content to accept that practice when the product is software.

Hi there,

A couple of years ago, when I was unable to use an amprnet BBS, I used
a BBS somewhere in the US to speak to my friend, G4VWL via the
internet. I sent my email via internet, he received it via amprnet,
and his replies came back to my internet email box.

Does such a facility still exist, and if so, could someone point me in
the right direction for information about how to use it?

Thanks,
Ian G7LQU.

>Jolly Roger and condone this rip-off.

Another person who assumes that all hams believed the NetRom claims in the first place.

Given two groups of geeks in conflict, both swearing that the other is in the wrong, the natural assumption was that both groups were full of farina and should be ignored until the matter was resolved. -- And that's what most hams did.
The fact that the matter was never resolved has since confirmed the wisdom of ignoring the claims of both groups.

When you then set the controversy aside, what's left is a choice between expensive software which cannot be updated without additional loss of time and money, or free software for which regular updates would be easily available.
The fact that the NetRom software was hardly ever updated or improved while TheNet continued to develop and improve has since confirmed the wisdom of those who decided to go with TheNet.

In south Texas, where I lived at the time, the most widely-held opinion on the matter was that the NetRom folks were throwing a hissy fit over losing a monopoly they imagined they would have had. They reacted like spoiled children when presented with the "competition" from TheNet, and nobody felt too awfully sorry for them.
.
-- Remember that this is not intended as a statement of fact, but rather a reflection of the general opinion on the matter at that time/place. It may have been a regional thing, but my bet is that those sentiments were common all over the US.

Some of us doubted that TheNet was legit --- But many more of us were absolutely positive that the NetRom people were complete morons for handling the matter the way they did, creating and maintaining bad feelings among hams for years in order to support their paranoia instead of acting professionally and resolving the matter.

Additionally, many of us did not appreciate being told that "the Germans" allegedly did it. (Most particularly the Germans among us, I'm sure!.) The semantic blunder of accusing an entire people instead of the individuals

involved was committed over and over again, and continues to this day. It is this sort of behavior which has inspired me to use the term "socially retarded" in connection with the way the NetRom folks have handled the deal, both then and now. If they had had the stones to name names, things might have been very different.
But they didn't.

And so, the un-named German programmers ended up with the benefit of the doubt on their side. They wouldn't have had that, but for the socially retarded antics of the NetRom folks. Yes, the NetRom folks cut their own throats, and got a bloody mess all over amateur packet radio while they were at it.

And you are right, Gary. Some hams really DID believe the NetRom story that was being given out, and utilized TheNet anyway. Not a significant number, but some nonetheless.

>Most people seem to realize that
>one can't just make a carbon copy of commercial hardware and
>represent it as your own product. But they seem quite content to
>accept that practice when the product is software.

Again, you assume that all hams thought TheNet really was a copy. - And in that you are wrong.

I suppose it must be easier for you to run down your fellow hams with another "cheap ham story" than it would be for you to take a few minutes to apply some thought to the matter.

>interference I'm getting out of it.

Yes, the KPC-2 generates a lot of RF noise!
I used it for a BBS and did a lot of experimentation to get it
"clean".

The following helped (try in the following order until it is good
enough for you) :

1. Insert a 3.5 mm jackplug into the speaker jack at the back of the
TNC and connect ground on this plug to your shack ground.

2. Put some extra solder on the edges (ground) of the PCB so that the
board gets a bit thicker at the edges. When the PCB is then inserted
in the case, there will be better contact from PCB ground to case.

2. Cut a thin copper sheat to the same size as the PCB. Cut a thin
plastic sheat to the same size. Place the plastic sheat on solder side
of the PCB and the copper sheat on top of that. Connect the copper
sheat to ground on PCB.

4. Take a large ferrite powder ring core and put ALL the cables to the
TNC through. Make as many windings as you can.

My TNC was nearly 100% interference clean after this operation.

TAPR is expending the bulk of its development funding on its spread
spectrum radio project (a projected budget of $200,000). That certainly
seems like an emphasis on high speed to me. TAPR has a number of kits
from earlier development efforts still available, and they support APRS
and HF DSP development too. But the bulk of their effort is concentrated
on the SS radio project at this time. I don't see how you could miss that.

That is not what most hams did. If they had indeed turned their backs
to both Software 2000 and NORDLINK, that would have been acceptable.
But of course that is not what they did. They sided with the pirates because
they didn't have to pay for the pirated code.

>The fact that the matter was never resolved has since confirmed the
>wisdom of ignoring the claims of both groups.

There could be no doubt that the codes were identical. Anyone with one
whit of programming experience could see that at a glance. The odds
of the two groups of programmers independently creating the same
exact code are so astronomical as to be beyond all credibility. One
of them was stolen. And priority of release belonged to Software 2000,
and NORDLINK *stated* that their code was a NETROM compatible
clone. The only "controversy" was whether the NORDLINK code was
independently developed or was a direct copy of NETROM. And there
was no real controversy over that either except by those who wanted
to justify participating in piracy.

>When you then set the controversy aside, what's left is a choice between
>expensive software which cannot be updated without additional loss of time
>and money, or free software for which regular updates would be easily
>available.

The choice was between legitimate software and pirated software. And
of course there was no contest. Those without morals or ethics chose
to use the stolen goods. No amount of rationalization can change that.
And no amount of carping about business practices can change it either.
Most of us have a constitutional dislike of Microsoft, but most of us know

it is theft to use pirated copies of Microsoft software, even if relabeled as Joe's software. Don't pretend to be so naive that you can't tell that you're dealing with stolen goods.

The software is in a rom thats in the AEA. The cable
goes into the cartridge port, and the C64 tries to load from
it before doing a console read. So, it will boot automatically on
every power-up. And you can have your packet parameters on a
floppy disk file, and it will read them in as it starts. -pat

I recently found a cool product called CD Doctor that will repair a scratched CD, DVD, ROM & Laserdisc. It really works and they give a 100% manufacturers guarantee.

I thought my DVD was ruined until I tried CD Doctor. I recommend the Trauma kit. It costs $9.99 and will fix about 40 discs.

Also, almost all my KPC2 RFI was EXACTLY on the then-popular 145.010
frequency. Moving the operating channel was another cheapskate way to
alleviate at least some of the noise and RFI. Selling the TNC and
upgrading to Digicom and Baycom modems (no RFI at all) was the best cure
for me.

"Piracy" is a harsh term for using code that's in the public domain to
set up a node that is for general ham use, and not for personal
profit.

That's a load of crap, Gary. For you, it may have been a clear issue
at the time. For others, it was not nearly as clear. And some, like
myself, bought one or more NetRom chips, and would likely have stayed
with them if they'd continued to upgrade and support the code at a
competitive price, rather than go into a snit, start whining about how
they were getting ripped off, and then jiggering their code so it
wouldn't interconnect properly with TheNet nodes.

By the time most hams started putting up TheNet nodes, the NetRom
folks were out of business.

As for Microsoft, there's plenty of folks who'll be happy to tell you
how much code they've stolen, too.

Bottom line, end user hams should not have been expected to play judge
and jury on the NetRom/TheNet conflict. Burning TheNet code into a
chip is a far cry from duplicating a Microsoft disk, using shareware
without registration (which almost ALL of us have done at one time or
another), or getting a crack or serial number for a game or program.

Well, I'm going to have to stick with my original theory. This discussion
has only served to verify that I was right in the first place... The NetRom
folks may or may not have been ripped off, but their behavior since has made
it plain that even if they WERE ripped off, it really served them right.

Gary and Carl's responses have served to remind me just how socially
challenged many of our geeks and nerds are, which in turn has made it much
easier to see why the NetRom folks could be intelligent enough to write C
code, but were like a fish out of water when they had to deal with a
situation involving people.
One is reminded of the stories about Pinheads who can't handle the
intricacies of toilet training but nonetheless possess some astounding skill
in math. -- Idiot-Savant talent, they call it.

Am I saying that Gary, Carl, and the NetRom boys are congenital idiots?
Well, no, but I'm not saying that they strike me as being particularly
bright, either. A clinical psychologist may not look at them and say " Idiot
Savant ", but if he did, he wouldn't be far wrong in my book.

Ah, well.. I suppose there are worse things than having to put up with
fussy, narrow-minded, anal-retentive personalities. One time I had a
girlfriend like that, and she was very handy at doing nit-picky kinds of
stuff like separating a box full of resistors by color code, ect. -- They
make good carpet pickers, too, so let's not discount the positive side of
the situation.

Well, I'm going to have to stick with my original theory. This discussion has only served to verify that I was right in the first place... The NetRom folks may or may not have been ripped off, but their behavior since has made it plain that even if they WERE ripped off, it really served them right.

Geeks: Circus sideshow people who are somewhat beyond the pale, socially. A geek might, for example, have no problem eating a handful of worms or sitting in a cage and occasionally biting off a live chicken's head for everyone's amusement. In modern times, the term Geek has seen widespread use in describing the behavior of engineers, programmers, and other folk who are technically gifted but who are also somewhat retarded, socially. Those unfortunates are often referred to as "geeks", even if they have never bit off a live chicken's head in public. They find other ways to go beyond the pale.

Gary and Carl's responses have served to remind me just how socially challenged many of our geeks and nerds are, which in turn has made it much easier to see why the NetRom folks could be intelligent enough to write software, but were at a severe disadvantage when they had to deal with a situation requiring basic social skills.
One is reminded of the stories about Pinheads who can't handle the intricacies of toilet training but nonetheless possess some astounding skill in math. -- Idiot-Savant talent, they call it.

1764. TNC initiation problem with GP and SP.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-05 00:00:00 UTC
From: Marty <martyk@naples.infi.net>
Message-ID: <35278C41.4AACD2DA@naples.infi.net>
Source record: 24535

I use a little batch file to kick my pk-232 into kiss mode for use
with the Graphic Packet and Eskay Packet DOS-based programs. When
this was used on my old 386-40MHz machine it worked fine, but when I went to a
Pentium 100MHz cpu I found that I had to initiate the
program twice in a row to have the pk232 go into kiss mode.

It almost seems that the new cpu is too fast to catch the all of the
initiation commands.

Is there any way to pause between commands (automatically) to slow it down?
Or any other ways to get the kiss sequence to work the first time? The kiss
file is simply 3 lines: ***, kiss on, restart.

Thanks for your help.

Marty

1765. G8BPQ(node) to FLEXNET 3.3G(E) via ethernet?

Dear Digi
Ham's

Could
anyone
give me
some tips
how to
link BPQ
node and
Flexnet
3.3G
windows95
via
ethernet.

Since I
own two
KISS
tnc's I
use BPQ
node
software
on my two
node
computers
and
Flexnet on
my
Windows95
computer.
Linking
BPQ to
Flexnet
3.3G via a
serial
KISS port
works
perfect,
but due
the lack
of ports,
I'd rather
link via
ethernet.

The ethernet part on the BPQ node works fine. Maybe the solution is to use Flexnet 3.3e with digipeater on one nodecomputer and BPQ on the other node computer but I didn't try that jet, ore..... I am just missing something in the protocol configuration.

So if anyone could give me a hind on what to do, it would make me very happy.

1767. HELP ic-251a

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-05 00:00:00 UTC
From: "Matthew S. Mayfield" <msmay@ricochet.net>
Message-ID: <3527D539.C8C8B2D4@ricochet.net>
Source record: 24538

I have a ICOM-251A 2-meter all mode. The RIT stopped working. When I would depress the RIT switch the RIT light would come on, but would not stay on unless I held the button down. After studying the schematic I found that the RIT was engaged via a D flip-flop. (NEC D4013C) So I decided I would change that IC. After changing the IC the RIT worked like it was supposed too. But it also created another problem. The radio

now tunes in (FM mode) 15kc where it is supposed to tune in 5kc steps and with the Tuning Step engaged it tunes in 3kc steps it should be 1kc.

The chip I replaced it with was a Motorola MC14013B. Is there a difference between a 4013C and a 4013B???? I have checked all the header

plugs I removed to change the chip they all look correct. Help!?!?!? this is driving me crazy.

Yes, the MFJ 1278B comes with a 1200 radio modem.

I tuned my 1278 by ear and it works great; however, the
scope should help to get it to 100%

The manual goes into lots of detail on how to set it up.

Check out APRS for lots of packets to see if it's working ok.
145.79 or maybe 144.39

I hope this helps,

I just hope they don't finish the thing -- just in time for
the FCC to take 902Mhz away. SS modems? Are they RF modems, and
did they have Ethernet interface? You guys are cheap. I can
barely do a one fair computer game for 200K. Maybe EE's are
cheaper than programmers, nowadays.

1776. KAM Capacitor Help Needed:

1777. pk-88 no terminal text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-05 00:00:00 UTC
From: Steven Jackson N3VZL <steve@gnosis.slac.com>
Message-ID: <Pine.LNX.3.96.980405180923.25945A-100000@gnosis.slac.com>
Source record: 24548

Hi everyone -- I just picked up a PK-88 for developing a node for my club, and I can't get any text to appear on the terminal screen! I've had a PCB-88 (the ISA-card twin) for years and used that on APRS, JNOS, and straight AX.25. Hitting * takes the PK-88 out of reset mode, but I never get the welcome screen. I can hit * and type reset all day without ever seeing anything on my terminal window.

I can even blindly connect to a station that I know is on frequency, and confirm the connection with the lights on the TNC and the tx light on the HT, but I never see a single character of text on my terminal window.

What do I need to do with the PK-88 to get it to send data to my terminal? I've tried 8N1 and 7E1 at 1200, 2400, and 9600 baud on two different computers. The TNC is driving the radio, but it's just not sending any data to the computer's serial port no matter what I try.

Any help would be most appreciated.

wrote:

>I am wondering it the software for an AEA PK-64 is built into a cartrige
>or if there is some software on disk somewhere I would appreciate some
>help on the topic.

The PK-64 uses a ribbon cable to connect between the cartridge port of
the C64 and the hardware interface. The hardware interface has the
typical components of a cartridge, i.e. address decoders and eproms
for the program, and additionally it has an HDLC controller chip, used
to encode/decode the packet protocol. It also has the analog modem,
and if the HF option is installed, another little PC board that has
analog audio filters to FM detect the HF FSK signals, along with a LED
tuning bar graph to aid the user in proper tuning.

Hope that helps!

They're not paying themselves anything, Jonathan. But they are zero base budgeting, IE figuring as if they didn't even have a paper clip between them at the start of the project. TAPR says it cost about that amount (zero base) to go from the original idea to the TNC2 in full amateur kit production, and they expect the SS radio project to ultimately cost about the same (I think they're optimists, they didn't need spectrum analyzers or high speed logic analyzers to develop the TNC2).

The budget is designed to address the tools they need, the prototyping costs, sets of beta test radios, and ramp up costs for full kit production. (Plus the miscellaneous overhead required to coordinate a volunteer group effort and keep the membership informed and motivated.) They haven't spent much yet, and some of what is in the budget may already be owned by one or more of the volunteers, or can be moonlighted from their employers, or like TAPR's website and SIGs, is already funded by other projects, so it won't represent an actual additional cash expenditure.

PSR says the TAPR BOD has authorized up to $10,000 in real money to be expended on the project in 1998. Among the things for which they are shopping is a good compiler and development system for the communications processor chip they've chosen. And they've got to pay the board house for some prototypes, buy parts, etc.

They probably won't spend the entire allocated amount if history is a guide, since most TAPR volunteers have shown a talent for avoiding spending money (IE they're scroungers, like most hams). But they need to not be afraid to spend something to avoid having their development timetable slip too much. That's something all too common to TAPR projects (and to other amateur development efforts too). Volunteer labor will burn the midnight oil, but in the daytime they have real jobs to consider. It isn't quite the same thing as an entrepreneurial tiger team.

They are taking a big risk since the FCC hasn't issued new SS
rules yet. It would be unfortunate if their design can't comply.
And there is always the possibility that amateurs may lose
902 MHz. That would really screw the pooch since, unlike the
GRAPES RF modem, this thing is designed only for the 902 MHz
band.

>SS modems? Are they RF modems, and
>did they have Ethernet interface?

Yes and yes. The TAPR SS radio is intended to be a complete
RF modem from antenna connector to ethernet interface.

>You guys are cheap. I can
>barely do a one fair computer game for 200K. Maybe EE's are
>cheaper than programmers, nowadays.

Well do remember that the TAPR labor is all volunteer. But also
remember that they don't have a fully stocked R&D facility to
draw on either. TAPR doesn't own a spectrum analyzer or a
development system or a protocol analyzer suitable for this
project. Their zero base budget assumes that they don't even
own a paper clip.

1786. KAM Choke Help Needed (now):

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-06 00:00:00 UTC
From: "Scott D. Carter" <captsdc@aloha.net>
Message-ID: <35295D90.9480A7B@aloha.net>
Source record: 24556
Body handling: Binary attachment payload not displayed: vcard.vcf

I had a lightening strike take out a capacitor (not to mention my
power supply transistor) in my KAM TNC and have I no schematics.
The tantalum cap near the regulator was cooked and I replaced that, but
now
RFC-1 next to it cooked off. It had brown/black/black/gold bands and
was an axial, turquiose color. The board in the KAM is a vintage 1986
that has a PC-20 designation on it.

Can someone tell me what RFC-1 is?

Please shoot me an email at captsdc@aloha.net

Regards,
Scott - WH6FQ

```
Dayton 1998 TAPR Digital Forum and PACK*BASH
============================================

The TAPR Digitial Forum is at 10am on Friday. This is an earlier start
then from past years. Check out the web page
http://www.tapr.org/tapr/html/dayton.html for full details and schedule.

The schedule for the TAPR Dayton HamVention digital forum is:

10:00 - 10:05 Introduction
John Ackermann, N8UR

10:05 - 10:30 TAPR Kit / Project / Organizational Update
Greg Jones, WD5IVD

10:30 - 10:45 Regulatory Issues
Dewayne Hendricks, WA8DZP

10:45 - 11:30 Spread Spectrum
Tom McDermott, N5EG/Bob Stricklin, N5BRG

11:30 - 12:00 GPS Projects
Steve Bible, N7HPR/Tom Clark, W3IWI

12;00 - 12:15 BREAK

12:15 - 12:45 Linux AX.25
John Ackermann, N8UR

12:45 - 13:45 APRS
Bob Bruninga, WB4APR, etc

-----------------------------------------------------

PACK*BASH and TAPR Banquet

What?
An event for the digitally-inclined ham, featuring:
* Buffet dinner
* Keynote address by (TBA)
* TAPR special interest group meetings
* "Birds of a Feather" gatherings

When?
Friday evening, May 15, 1998
Doors open at 7:00 pm; dinner served at 7:30 pm
Speaker and meetings after dinner
```

Where?
NCR "Sugarcamp" Conference Center, 101 W. Schantz Ave. --
South of downtown Dayton, just west of Main St. (Rt 48).
Maps available on the TAPR web site or at the TAPR booth.
(http://www.tapr.org/tapr/html/dayton.html)

How?
Dinner requires advance registration and payment through TAPR.
Tickets will be available at the TAPR booth on Friday, though
we strongly encourage registration <before> Hamvention. The cost
is $20.00 per person, tax and tip included.

All amateurs are welcome to attend, enjoy the speaker, and
participate in the meetings, although only those purchasing a
dinner can eat.

To register, contact:
PACK*BASH
c/o TAPR
8987-309 E. Tanque Verde Road #337
Tucson, AZ 85749-9399

Phone: (940) 383-0000
Fax: (940) 566-2544
Internet: tapr@tapr.org

Visa/Mastercard Accepted

Who?
PACK*BASH is co-sponsored by TAPR and the Miami Valley FM Association,
Dayton's packet radio club.

For more information (including maps),
go to http://www.tapr.org/tapr/html/dayton.html, or send e-mail to
tapr@tapr.org. You can request information via packet radio at
BASH@N8ACV.#DAY.OH.USA.NOAM.

1791. QPSK modulation techniques

Message-ID: <6ggaqk$d0d$1@nnrp1.dejanews.com>
Source record: 24562

I've browsed the web a bit and i've notice that there are many companies that specialize in wireless networking. Does anyone know if some of these ready-to-use products could be used on the ham bands? that would sure make things simpler if I could swap a crystal here, an IC or two there, and then start thinking about applications.

1799. DSP-2232zx and lagacy of AEA DSP-2232 ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-09 00:00:00 UTC
From: ggrey@nojunk.ihug.co.nz
Message-ID: <352c7689.6332663@newsource.ihug.co.nz>
Source record: 24475

Hi,

Timewave have announced their new DSP-2232zx which is a combination of
the legacy of the AEA DSP-2232.

What is the legacy of the AEA DSP-2232?
Was the DSP-2232 any good?

Timewave is to announce a trade-in plan to DSP-232 owners as an
upgrade to the new DSP-2232zx.

The DSP-232 I have has many problems and I will be thinking very hard
about upgrading.

Hello EveryBody out there in Computer & Radio Land.
How are you ALL !!!!

Does anybody out there have the Programming Software for
a TAIT 2000. lt is a UHF Model. with ranges from 470-512 MHZ.
l believe from the top of my head, it's a 2000-611-015, or
2000-611-215, or something like that.

l think it comes in two or three floppy disks.

Please can anybody help me, out there,
can send you excellent top-of-the range programs, anything you
need, because l know how to repay a favor !!!!!!!

Also l have hundreds of Radio Modifications to give to you.

Also if you have the service/operation manual, that would be nice to.

Thank you very much and i hope to hear from you soon ...
(: SMiLE :)

Message-ID: <352CD020.792AC7C4@eds.tinker.af.mil>
Source record: 24479

AEA was trying to lead the way with new technology. They failed.
But they weren't the only ones who failed with DSP. I think the
best DSP for the money was (is??) the TAPR board buy from Motorola.
TAPR is working on a simple interface board for it, and that should
put you in DSP with some great homebrew modems for a fraction of
the $1k the AEA and others cost.

Tou might be able to use the AEA case, just throw out the guts.

For those who haven't seen it yet, you need to stop by:

http://www.qsl.net/n6lyt/index.html

John Melton, N6LYT has a great java program, as well as
source code to the whole Java Satellite Ground Station.

What I find interesting, is a complete AX.25 and serial
port implementation in Java (well serial port uses native
methods, but that's even much nicer).

I think this will be "the" software that everyone bases
their code on (much like Karn's NOS).

From: Robert Switzer <rs2@mink.mt.att.com>
Message-ID: <352D20FE.5450647F@mink.mt.att.com>
Source record: 24482

Folks,

I've seen the interfaces using the 741 opamps to decode (and encode)
digital signals such as RTTY/AMTOR and lately (in Electronics Now)
for POCSAG (pager signalling). The interface is nice, but every author
wants you to get their software. That is a great way to get started, but

having done software development, I wondered where the specs are
for writing my own. I would guess I could go off the timing and coding
specs for the various modes and write my own timing loops to detect
the edges on the TX/RX lines, but I wanted to know from someone
experienced,
am I on the right track?

Thanks for any help.

1810. Early MAC Software for Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-09 00:00:00 UTC
From: Steve Vaughan <vk4yek@logicworld.com.au>
Message-ID: <6gfimk$q7f$1@news.logicworld.com.au>
Source record: 24569

Hi all , I am trying to track down any packet software for early macs (lc2 etc) that make use of FBB features (compressed download , unproto lists etc). I have Virtuoso V1.4 , I wonder if James ever released a later version ?????
Regards Steve.

1811. used tnc

hi,
we are looking (My Radio Club) for used tnc that have trouble and the
owner are not interested to keep it and won to give them or it!
we are a small club and we can not afford to pay for it ,we have excellent
tech for the rebuilding of them ,so if you can help us we will appreciate
any help!

we are working now on a gateway but the cost of the sun server have clean
the bank acount so we are trying around for any help!
Yes if you like it is some kind of charity but i would call it a Helping
Hand!

Bye and good packet!

hi all,
where can i found the version of TNOS/UNIX of ko4???? for a project of a Gateway on the internet and the Packet radio system.
I am looking for a kind of FTP site that would have the necssary kit for a start.
we would had own IP adress and some text and call sign.

Here in Rimouski,Quebec i have no one that can help us so i am trying here there must be some one to help us!
we have a Sun Unix Server at service for that job,to bad we have no-one but we will succeed!

so i am waiting for anyhelp ,thank's for the chance to speak to the Community of Radio-Amateur,Ham Radio Operator.

1815. DSP-232 not a viable product.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-09 00:00:00 UTC
From: ggrey@nojunk.ihug.co.nz
Message-ID: <352c72a2.5333723@newsource.ihug.co.nz>
Source record: 24574

Hi,

I just made enquiries with Timewave on the progress of upgrades for
the DSP-232.

The service manager replied that there are too many hardware and
software problems with the DSP-232 and that it was not a viable
product.

Timewave is to offer a trade-in discount on a DSP-2232zx.
As an alternative Timewave is to announce a repair policy that will
bring the DSP-232 back to version 1 standards.

That is a change from my contact with the technical manager 6 months
ago who said that there was not much wrong with the hardware and that
Timewave was going to re-write the software.

1816. Please help with sv2agw software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-10 00:00:00 UTC
From: "Peter Berrett <pberrett@" <"remove this spambait>tbsa.com.au">
Message-ID: <6gk5ek$bim@news.tbsa.com.au>
Source record: 24486

Hi all

I am trying to get the sv2agw software up and running on my system. I am having some difficulties though. Could someone please help me?

Firstly I have a 686 with 16 meg ram running win 95. I have plugged my Baycom modem into port 1. There appear to be no conflicts on this port.

What I am trying to do is start up agwpe (the socket program) and use agwpe's terminal program with this. I have carefully and correctly configured the program as per instructions and put bwcc32.dll in my windows/system folder as required. I have turned off the fifo buffering option in the windows control panel settings.

Secodnly I should add that the Baycom modem works fine with the Baycom software under dos. Clearly whatever the problem is - it is a software problem.

Anywat I start up agwpe as instructed and then the terminal program. The ternminal program works fine for about 30 seconds. I can see packets of data being decoded and displayed on my screen. More importantly I can see the little modem icom in the bottom right hand part of the screen occasionally flashing a little green light which shows the virtual modem is decoding correctly.

So reception for the first 30 seconds or so is fine. When busy about a page and little more will fill up with the received packets. However after a period of about 30 seconds the socket program/virtual modem ceases to function. No more decoded packets, no more flashing green light even though i know that the traffic is still busy.

I believe the problem may lie with the agwpe program. If I start this without the terminal program the green light will flash for about the same period of time then no more flashing. If I start the terminal program now nothing is seen to be decoded.

I think that there is some sort of buffer overrun problem in the agwpe program.

Another problem I have is that when I try to connect to a station, the programs do not cuase the push to talk button ot key. Also testing of the audio out pin on the modem shows that unlike the baycom program there is no audio being generated.

Has anyone any experience with this software. It looks really good and I am keen to get it going. Any help people can give me would be gratefully appreciated.

cheers Peter vk3pz

The allegations that I heard at the time was that the German group and the USA group had been collaborating on the development, came to some discord and split, and when the USA people began marketing it instead of giving it away as originally intended, the German group decided to make their version available. It's not clear as to how far along the project was when this all is alleged to have occured.

This, to me, sounds much more believable than other versions I've heard, but I have no firsthand knowledge and can't make any claim for its truth.

We'll never know, short of strapping key players down and administering hypnotic drugs, which seems highly unlikely to occur.

Since it's no longer possible to buy "legitimate" NR chips, the entire question is moot now. And no longer worth arguing. Unless you really have no life at all.

1819. AEA & windows 95

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-11 00:00:00 UTC
From: Dan <cardan@mail.earthlink.net>
Message-ID: <352F773A.38C4@mail.earthlink.net>
Source record: 24489

I bought an AEA pakratt 232 and their program PakRrat Ver. 2.0 back in "96
It worked fine until I installed windows 95. It loads the paramenters , then nothing shows up when I get a signal. I'm having difficulty getting ahold of AEA.

The tech rep. at AEA in '96 said the program works in windows 95 dispite the warning, then hung up. I have heard they are out of bussiness, but they still have an old web page. I became so frustrated in '96 I put it in a box and just pulled it out again. Any ideas on why it worked great in 3.0 but not in 95?

Is Kamtronics still in bussiness and what is the popular mode now.
It was Pactor in 96. Thank you. Dan, cardan@earthlink.net

PS: I am about to use this thing for a boat anchor, but I can't hear well, so digital is nice.....

I dont know why your having problems with it. I have been using it
with win 95 since win 95 came out and have no problem. Windows gives
me the noteice that it may not run correctly under win95 and asks me
if I want to run it anyway and I say yes and have no problem. Do you
have the right comm port selected and everything setup O.K.?

And by the way if you do not want to see the warning you can set the properties for your shortcut to PakRat to not allow the program to be able to detect windows.

Right click on the shortcut and select properties. Next click on the Program tab then click on the advanced button. Here you will see a check box to "Prevent MS-DOS-based programs from detecting Windows". Select this and you will not see the warning again.

It works OK with Win95 here. Must be a setup problem. PC PakRatt can be
picky about that.

I hope it starts behaving itself soon!

:> Viorel Anghel

More to the point you don't *have* to *install* Linux.
It is possible to boot some distributions right off the
CD and run them without installing them.

Also there are some (admittedly tiny) configurations of
Linux you can run from a boot diskette or a boot/root pair.
These are minimalist configurations --- but they are enough
to "get one's feet wet" with a shell, a copy of vi and
a few useful tools like Lynx and pppd.

If you're willing to "install" a normal DOS shareware or
freeware package you can install DOSLinux, MiniLinux,
Monkey or XDenu. These are distributions that you install
(just unpack really) into a subdirectory on any DOS filesystem
and run with LOADLIN.EXE. They mount their root fs on
UMSDOS (a set of Unix compatible extensions overlaid on an
MSDOS fs).

If you're willing to "install" an extra IDE or SCSI drive
in your system you can get a LOAD (Linux on a Disk) distribution.
It doesn't cost much more than the extra disk drive.

Most importantly if you want to play with Linux and Unix
in order to learn more then you should make *learning*
your priority --- and *learning how to install it* naturally
precedes that.

What you learn by installing Linux or FreeBSD is more than
just Unix. You end up learning quite a bit about the quirks
of the PC architecture (and ultimately may come to view the
common conventions of that market as the accretion of
patches to overcome silly design decisions that it really is).

1826. Kam ver 5.0 Question on both ports?

Newsgroup: rec.radio.amateur.digital.misc

Hi all,
I want to know if the kam ver. 5.0 will work with both ports?
That is I want to be connected to the packet cluster (vhf port) and be
able to work rtty station (hf port). So they share the com port so to
speak.

Can I do this?
If not can I do this with the enhancement board?

I do have another tnc, however, I am out of com ports. I would like to
have one tnc do both.
Pse email me

>Pse email k5kip@qsl.net

Yes, you can. The easiest way is to use a commercial package like PC Anywhere. Set the remote machine up as a host, allow the remote machine to act as a "host", put the control software on the remote machine. PC Anywhere will let you control all the functions of the remote machine at your PC, in a window. You can still run other applications on your console as well.

If PC Anywhere is too pricey for you, there are several shareware packages that do mostly the same thing.

I agree. It runs fine in the DOS window. But at one time I had a problem with
a loose contact at the cable connector, which caused a similar problem.

Hi Kip,
I don't think this would work, if you start a program on a server tru a network it's still gonna run on the client machine, therefor it'll use the client's ports
One way I do it is either use PcAnywhere (or simular) or run JNOS on the tnc-side and telnet from another pc (ofcourse if you use Linux on your machines you can run anything from anywhere!)

Does the PK96 support multiple connects to its mailbox? If it doesn't how does one get mulitple connects for mail? I guess you have to run a software package on a computer....

Any suggestions on an easy software package?

Steve N0FPF - Seattle

Kantronics never made the AEA units. AEA went bankrupt a couple of years ago and Timewave bought their product.

I'm not suprised your having problems with 16 bit code under Windows 95. Many badly designed 16 bit programs fail under Windows 95.

Kantronics is at http://www.kantronics.com. Might want to box up the AEA and get a KAM.

1837. Re: Kam ver 5.0 Question on both ports?

If the Kam 5.0 firmware supports Pactor, then yes it will. If you have Windows 95, you can download Pacterm 98, at http://www.cssincorp.com/pacterm which will let you run the packet cluster in one window and the Pactor session in another.

What a hilarious thread.

It just goes to show that all amateur radio software needs
to be GPL'd (or any of the other flavours of free license).
The profits to do clean-room re-implementations just don't
exist in amateur radio, so it makes sense not to spend money
reinventing the wheel but to build on the work of others.

It's also usually quicker to take open source and adapt it
rather than to start from scratch, so not freeing your code
and not building on the free code of others holds backs the
rate of progress in the hobby.

Rich.

Timewave will NOT offer any further support for the DSP-232 (it
bankrupted AEA!) and are about to release the DSP-2232zx. According to
e-mail I had from them they will offer a trade-in against a DSP-232.
(The final trade-in value has not been confirmed but I have been quoted
$400). The new TNC is on their Web site.

I found myself nodding in agreement as I read your post. - It makes great sense.

On the other hand, look at *NOS.. Ten years or more of the open development you described produced very little (if any) by way of advancement. In a general sense, the tacking on of basic Packet BBS functions was about all that was accomplished in all that time. This, by what was allegedly the best pool of programmers ever to be associated with amateur radio. Real cutting-edge kind of folks. "Do-ers", according to Greg Jones, president of TAPR. If Greg was right (and I'm not saying he was) then the idea has been fairly tested - and it failed miserably.

So, though the concept sounds very reasonable on paper, I'm going to have to reserve judgement in light of the system's track record to date. I'm not saying the idea is no good. I'm saying that I'm going to have to reserve judgement until I can see what another group of programmers does with another project. So far, the evidence does not support this very attractive theory, but I've got a feeling it's potential wasn't very fairly represented by the activities of the amateur tcpip community.

I do, however, have high expectations in connection with the APRS programmers I have run across. They seem to be taking the concept you describe very seriously, and appear to be result oriented folks who are a credit to ham radio.

Hi Steve

I'm have been using a Baycom board for my tests - its a bit tricky doing too much here as I'm the local hub with 2 user ports and 3 link ports blasting TCP/IP over the airwaves 24 hrs a day.

The tests I've done so far have been very encouraging though, the SV2AGW software is now very stable and its still being developed hence support is not a problem.

I've used it with IE4.1 so I've tried the HTTP which works great to the pages I have on my Linux hosted (JNOS) hub and Outlook Express for mail and nntp (news) - the same as I use for my 'wired' configuration. I've downloaded the http/ftp server for win95 xiw3222.zip but I've not had a chance to try it out yet.

Other services I use are WS-FTP Lite as my FTP client, QVT Term for Telnet, TTYPACK for ttylink client and server and mIRC for the IRC gateway connection into the world-wide convers system.

Thats about it so far - I'm trying to get a couple of locals to test the whole package for me further due to the constraints in making valid judgements when there is so much RF floating about!!

Cheers

Pactor was not supported until version 6.0 of the Kantronics
firmware. In addition several important polling commands for the TNC
status were not incorporated until version 7.0 of the firmware.

XPWIN will also run the KAM in split window operation
under windows. It does require version 7.0 or later of the firmware.

Hi,
I have a Icom 27-H that is working fine, EXCEPT the LED display. I am unsure if the problem is in the display or the chip that drives it, however if you have an old IC-27, 37A, or 47A (the LEDs are the same) that failed for some other reason that it sitting around in you way, just taking up space, and otherwise annoying you (or your YF), this could be your OPPORTUNITY OF A LIFETIME, YOU may HAVE ALREADY WON!!! (Oops, forget that part about winning, I just got carried away, you didn't win anything, and I am sorry that I even brought it up.)
Nevertheless, perhaps we CAN help each other out by me sending a little money your way and you sending your junk my way. Plus, we can keep one radio out of the local landfill and HELP SAVE THE EARTH FOR OUR CHILDREN AND GRANDCHILDREN!! (Yea! That's the ticket. Yes it IS hyperbole, but in THIS case, it is at least TRUE hyperbole.) ;->

Thanks for reading this. Even if you have no interest, I hope you enjoyed my bs.

Best of Luck & 73,

Don W9DEW

Hi,

I am looking for a prices and suppliers of a DSP56002EVM.
I note that TAPR have closed their current group purchase.
I can't find a price on the TAPR Web site
The price from a New Zealand supplier is NZ$330 which is approx US$178
plus the cost of shipping.

Anyone got any more info?
Many thanks.

I bought mine from Macro (a distributor in the UK) for 125 UKP plus shipping,
so your NZ$300 looks about right.

The TAPR group purchase was a really good price (less than US$100), but
they are not getting any more.

1861. BPQ, ODIDRV and Ethnernet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-15 00:00:00 UTC
From: hansenr_NOSPAM_@online.no
Message-ID: <3534a21a.4223485@news.online.no>
Source record: 24432

Hi HAM's
I'll have the local DXCluster and BBS inn my QTH and tying to use BPQ
and ODIDRV so my problem is:
I.m trying to connect to BPQ nodes via Ethernet using ODIDRV. My two
Computer are using SMC ethernet cards and LSL.COM and SMC8000 driver
are loaded before ODIDRV is startes. Net.cfg are setup for BPQ. But
i'm not shure about bpqtxt.cfg. Is there enyone who kan help me?
Please send me some samples and hints.
PS When i'll try to send someting over ethernet i'll can se LED's my
HUB i blinking but notthing happens.

I you like you can also send ann CC to my e-mail adress

Sorru abt my bad grama. I'll write good inn norwegian, but :-))

Hi all.

You can get it in the US for US$149. Check
http://www.arrowamericas.com/

Take care... Prices vary from this value to $283 (yes... 283!)

Message-ID: <353508A7.12AF@midstate.tds.net>
Source record: 24434

Has anyone managed to get Street Atlas 4 or 5 to plot APRS
data received over packet radio?
Just added the Magellan upgrade to my copy of SA4 and got the two
to work together. Now the next logical step is to be able to track
a mobile from my shack on Street Atlas. Any ideas?
73 & Thanks

But why not try to find the parts, rather than looking for a junk rig?
What's the driver IC? It might be a common part, or a common part could
replace it. Is there something special about the LED display? It too
might be a common part. If it's actually made up of a number of seven
segment LED readouts, the chance increases that you can find a replacement
or something that will work.

Why not try to figure out where the problem lies; in the readout, in the
driver or somewhee else? An LED readout, even a multiplexed one, is
fairly easy to check by taking a 9v battery and about a 1K resistor and
adding a couple of wires as test leads. Connect one wire to any terminal
on the LED readout, and then connect the other wire (which would have the
resistor in series with it) to the rest of the terminals. Eventually, you
will get a pair that lights one of the segments. If that doesn't happen
at all, then move the first lead to some other pin, and try again.
Working through the pins, you will be able to identify what each pin does,
and determine whether any segments are not working.

If you find a bad segment, then you know where the problem is. Since
you've traced out the readout, you then know the pinouts, so you should be
able to find a suitable replaement.

If all the segments work, then you know it's not the readout. You can
tell by what segments don't work where the problem might lie in the
driver. If the readout is completely blank, look first towards something
that is common. If all same segments on each digit (assuming it's a
multiplexed readout) don't work, then it's the common pin for that
segment. If it's all of one digit that doesn't work, then it's the common
pin for that digit.

Since you know, from decoding the readout, which pins from the driver go
with what function, you could observe those pins and see if the signal is
there. Non-multiplexed readouts might be easiest, since you could likely
see them with a voltmeter or even a single LED in series with a resistor.
Multiplexed readouts would be pulsing the lines to the readout, and would
probably require an oscilliscope.

1866. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-15 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6h1u8s$htc@news.Hawaii.Edu>
Source record: 24437
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.digital.misc

```
Archive-name: radio/personal-intro
Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul
Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
newsgroups is so that folks who aren't interested in, say, homebrewing,
don't have to wade through messages about homebrewing on the way to read
about Field Day. Posting appropriately is just good etiquette.
```

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

It is a bad LED display, 100%. That part is not common at all, in fact it
has ONLY been used in Icom 27A/H, 37A and 47A.

hallo leute,
ich hoffe, diese nachricht findet jemand, der sich mit alter ddr-technik
auskennt.
problem:
ich will mit einem U700-70cm-Geri¿½t packet radio machen.
fonie mit dem teil geht ufb.
ich hab ein modem (funktionsfi¿½hig) und einen computer (ebenfalls
funktionsfi¿½hig) an die U700 angeschlossen und es kommt kein signal raus.
:(
das modem ist in ordnung und funktioniert mit anderen geri¿½ten ohne
probleme.
hat jemand erfahrung beim einsatz dieser U700-kiste im PR?
bin i¿½ber untenstehende adressen zu erreichen.
BITTE HELFT MIR!
Ron

1872. TH-28A and KPC-3 Plus ??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-16 00:00:00 UTC
From: dhuggard@cts.com
Message-ID: <YqgN1UmbNzfQ091yn@cts.com>
Source record: 24443

I just purchased a KPC-3 Plus and I'd like to interface it to a Kenwood TH-28A. Does anyone know what the correct transmit drive voltage for the TH-28A should be? Also, any other problems or "gotchas" I should be aware of?

Thanks,

Doug -- WB6AJX

This is interesting!

Packet radio using a sound card - No TNC needed !!!
Source:
http://www.geocities.com/CapeCanaveral/Hangar/1632/flexnet.html

" This site presents a relatively new way to participate in packet
radio.
All that is needed is a PC with a sound card, some software, and of
course
your transceiver. The only catch is that you are required to build a
very
basic interface circuit to connect the sound card to the transceiver,
but
trust me it's simple.

The software that lets you do this is called PC/Flexnet. Rather than
try
to explain the software myself, you are better served if you go to the

official homepage of the Flexnet group in Germany. "
http://dl0td.afthd.th-darmstadt.de/~flexnet/

Comments from the Moderator:
============================
I've been wanting to try packet radio, but the cost of a TNC has
discouraged
me--until now! I found out about PC/FlexNet a couple of days ago, and
so far
I'm still interested. Here's what I have done so far---

First, I read the introductory document at:
http://www.geocities.com/CapeCanaveral/Hangar/1632/flexnet.html

Then, I followed the basic instuctions for Windows 95 at:
http://www.geocities.com/CapeCanaveral/Hangar/1632/basicpkt.html
to get the software downloaded and installed. Follow the instuctions
to start
the Baycomm style terminal.

I was able to run the software without any problems. I have not yet
built an
interface (it will be for a Radio Shack HTX-202), so I have not tried
PC/FlexNet
on the air. I plan to do so very soon! I'll let you all know how it
goes.

Absolutely. There's a piece of software called APRS+SA (available from the appropriate link on the TAPR site) that does exactly that. I'm using it with SA version 5, and it works very well. (IMHO, it's also got a much nicer interface than the WIN/MAC software that's also currently available.)

1880. DSP56303EVM v DSP56002EVM ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-17 00:00:00 UTC
From: ggrey@nojunk.ihug.co.nz
Message-ID: <3536f8cc.1998435@newsource.ihug.co.nz>
Source record: 24451

Hi,

I am interested in the DSP56xxxEVM for ham radio modems.
In NZ the 56303EVM is a little cheaper than the 56002EVM.
(Different suppliers)

On the surface the 56303 seems a lot better for memory (already
provided), I/O and speed. The package seems to include the same
support bits and pieces

Would code written for the 56002EVM drop into the 56303EVM?
Has anyone got a comparison chart?

Hope someone can help.

We have an engineering job opening in our development group here in Dallas, Texas.

We are part of the TIRIS organization, a division within Texas Instruments which develops and markets RF identification systems.

Our particular group develops product for the ARC segment (Automatic Recognition of Consumers). One important target for our products is the oil industry. You might have seen the Mobil Speedpass application, where one gets automatically recognized by the gas dispenser when fueling one's car.

The little electronic RF devices that Mobil issues are developed by us, we call them "transponders". They can either be on your keyring or be mounted in your car.

The devices work through an RF link, and also contain the necessary smartness by means of embedded software.

The associated reader equipment that goes into the gas dispenser is also developed in our group.

The person we are looking for has experience in receiving and transmitting techniques, modulation techniques, antenna theory, and some experience with digital electronics and embedded software.

I believe excellent engineering talent to be present within the world of radio hams. Therefore, if there is anybody that feels he or she fits the above profile, and holds an electrical engineering degree, please send us your resume.

Please send it to:

L.J. d'Hont Mgr development engineering TIRIS ARC segment

[Please forgive me if this appears several times... news server errors!]

Gordon West Radio School Presents:
T W O Special Classes!

No-Code Technician Amateur Radio
Licensing Class For Mariners
Friday June 5th, Saturday June 6th and Sunday June 7th 1998
At the lovely Del Rey Yacht Club, Palawan Way, Marina Del Rey, CA.

And

General 13-wpm Morse Code
And Theory Review Class
Saturday June 6th and Sunday June 7th 1998
At the lovely Del Rey Yacht Club, Palawan Way, Marina Del Rey, CA.

No-Code Technician Class for Mariners -- Class Instructor: Gordon West,
==================================== WB6NOA
This special class is designed specifically with mariners in mind. Learn how Ham Radio can make your next cruise even more fun! Stay in touch with fellow hams as you sail down to Baja, use ham radio phone patches to keep family and friends advised of your position. This fun and entertaining two-and-a-half day class starts on Friday afternoon and covers everything you need to get your Federal Communications Commission No-Code Technician license. Take the two multiple-choice exams right there in class and get your callsign two or three days later! Students who pre-register will receive the Gordon West "No-Code Technician Plus" textbook, theory cassettes, and a special pre-study package. The class fee includes nineteen hours of tuition, beverages, lunch on both days, a barbecue on Saturday night, and a special Saturday night after-class workshop detailing marine installation and use of ham radio onboard yachts and powerboats.

General 13-wpm Morse Code
and Theory Review Class -- Class Instructor: Julian Frost, N3JF
========================
This class is for mariners that want to upgrade to the General Class license, but like many people, find the 13wpm Morse Code requirement their biggest stumbling block! Make 1998 your year to upgrade. Don't let the Code hold you back any longer, the Worldwide HF bands are waiting for you. In fun, stress-free way, your instructor will take you from a shaky 5-7-wpm all the way up to 13-wpm, or higher, in preparation for your exam on Sunday afternoon! Techniques in passing the CW exam will be taught, and there will be multiple demonstrations showing just how easy it is for YOU to pass the 13-wpm, or even the 20-wpm code exam! Theory review sessions

are held throughout the two days to help make passing the written exam even easier. Students that pre-register will receive the Gordon West "General Class" textbook, Gordo's exclusive CW tapes, and a special pre-study package. The class fee includes sixteen hours of tuition, beverages and lunch on both days and a barbecue on Saturday evening. General Class students join Gordo and his No-Code Technician class for an operating session and workshop dedicated to installing, using and maintaining ham radio equipment aboard yachts and powerboats.

--==--

For full details on either of the classes described above, please call Gordon West at (714) 549-5000 between 10am and 4pm, Monday through Friday.

1886. Re: APRS - Delorme ??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-17 00:00:00 UTC
From: Mike Berg <mikeberg@midstate.tds.net>
Message-ID: <3538197A.4D39@midstate.tds.net>
Source record: 24457

This may be old news to some, however, I was delighted to discover APRS packet beacons will plot on the Street Atlas 4 maps. Using the right parameters, I was able to fool SA into thinking my tnc on COM 2 was a GPS outputting NMEA data.
I don't know how reproducible this method is with other hardware, here's my setup.

Mobile GPS unit: Magellan 3000 interfaced as standalone with a PK-96 tnc.
Configured as for APRS mobile use except GPS outputs
NMEA 183B sentence.
TNC settings:
MYC N0QBH-9
UNP CQ: v RELAY
GNMEA1 $GPRMC
GPSA ON
GLOC 4

Tracking unit: 486 running Street Atlas 4 with Magellan GPS patch.
MFJ 1270B tnc connected to COM 2.
2m receiver on mobile/APRS freq w/receive into MFJ tnc.
RX TNC settings:
MYC N0QBH
HEA ON
MA OFF
BUD ON
LCA N0QBH-9

Load Street Atlas as usual. With the mobile unit beaconing APRS data, click on the GPS box and select Initialize. In the next window I select Magellan from the type of receiver, COM 2 and replace the 4800 with 9600 to match the rx tnc's serial speed. Then I click OK. Usually the rx tnc will hear a beacon and plot it before the SA4 GPS init times out. If not, click OK and reinitialize again.

I suspect the main drawback to this method is that it can only track one object at a time without making a mess of the tracking logs.

Hope this helps someone...
73 Mike N0QBH

1888. What Is a Kantronics KAM 98?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-18 00:00:00 UTC
From: marcclarke@unforgettable.com
Message-ID: <3537fc84.1364301@news.frii.com>
Source record: 24459

Can anyone shed more light on the new Kantronics KAM 98 than the brief mention in the Kantronics advert in this month's issue of QST? Single port, HF and VHF packet, all modes included in KAM Plus says the QST advert, but the advert does not mention which firmware revision of the KAM Plus they compare against. Specifically, does the KAM 98 have GTOR monitoring in firmware?

Price?

The Kantronics Web page does not even mention the KAM 98. No specifications, no picture, no price, no announcement, nada. I presume the Kentronics page at

http://www.kantronics.com

must be maintined by someone other than Kantronics, as no competent corporate marketing department would actually announce a new box in QST and fail to provide full specfications and details on their Web page. Hey Kantronics, are you listening?

Source record: 24461

We have written a Toroid software package for use DC to 300 MHz. Many Years of research has gone into error corrections for the low perm cores , 200 & 360 degree coverage as well as SRF for series and shunt coils. Much of this has come about as a request from Micrometals. The pin point accuracy allows us to add a custom core feature for custom shaped cores, stacking cores side by side and machining custom phenolic cores from plastic, teflon, wood, ect...
Down load a demo or just view the software main screen at our web

The Radio Amateur is:
CONSIDERATE...never operates in such a way as to lessen the pleasure of other's. (unless of course it is a contest).

LOYAL...Offers loyalty, encouragement and support to other amateurs, local clubs, and the American Radio Relay League, through which Amateur Radio in the United States is represented nationally and internationally. (unless of course money is involved or in many cases little support shall be given if the ham is old (almost always the case) and the new ham is young).

PROGRESSIVE...with knowledge abreast of science, a well built and efficient station and operation above reproach. (unless of course you have any money the you become an "appliance operator").

*FRIENDLY...slow and patient operating when requested; friendly advice and counsel to the beginner; kindly assistance,cooperation and consideration for the interests of others. These are the hallmarks of the amateur spirit. (unless of course it is a flea market (every man for himself).

BALANCED...radio is an avocation, never interfering with duties owed to family,
job, school, or community. (this is rarely true. A good contester will leave the family on Christmas if there were a contest, a local kid, known as "The breather" sits by his "hamradio" day and night talking to anything that comes along except of course a girl. Finally the only thing most hams will leave their "ham radio" for is a cup of C O F F E E.

PATRIOTIC...station and skill always ready for service to country and community. (unless there is DX around or a contest, in such cases it is accepted to ignore any emergencies).

Please visit my World Wide Web Site, you have never seen a page like it.

You have not responded to my letter of September 27, 1997 where I
questioned why I was removed a VE. I have not violated any provisions of
97.525 or any other aspect of F.C.C. regulations that govern this hobby.
Thus unless you restore my VE status FORTHWITH I shall send the following
letter to newspaper editors throughout the country (on a staggered basis).
This is a threat. I believe fully in what follows. The only reason I have
not written this letter before was I was not motivated to actually send it.
```

Dear Editor,
There was a time when amateur radio provided a public service in training operators for military service, technicians for industry, fostered international goodwill and carried emergency communications. This rarely is true any longer. The technology has long ago left hams by the roadside. Today amateur exams are so simple children who can barely read can pass the test. All questions AND the answers are published in multiple choice format. The examinee knows the actual questions and answers ahead of time. The average age of today's ham is well over 50 whereas when I was first licensed the average age was 27. Hams are still communicating at 1200 baud when internet users fly along at 40 times that speed. As far as international goodwill, most hams rarely ask a foreign station anything more than what his equipment is, they do not care about culture, lifestyle or anything that really matters. Hams usually want the "credit" for having talked to 100 or 200 or more foreign countries (did you know both Hawaii and Alaska are separate "ham" countries?). If you have a scanner listen to frequencies between 145 MHZ-148 MHZ and listen to the content of the conversation. These are valuable frequencies that other public service and commercial interests could use PRODUCTIVELY. Cell phones have replaced the need for most emergency ham communications in this country. Hams use many other frequencies for little more than a discussion of personal medical ailments. Hams are required to serve the public but in fact they are serving themselves almost all the time. Worse they cause interference to other services (like your TV) and they erect large towers and guess what, there is nothing you can do about it. The F.C.C. is too underfunded to respond to citizen interference complaints and the ham radio lobby (American Radio Relay League) has caused both state and federal governments to pass laws that prohibit towns from controlling these large antennas.
The frequencies that hams use are for the use of everyone not their personal fiefdom. It is time Congress conducted hearings and investigated whether ham radio has become the vast wasteland (a term that former F.C.C

commissioner Newton Minow popularized).

FOR SALE: MFJ 1278 Multimode TNC upgraded to latest version 3.7 firmware.
Decodes RTTY, CW, AMTOR, VHF Packet, ASCII, SSTV, and HF WEFAX.

Included is MFJ Multimode 3.2 for MSDOS, manuals, cables, and optional
2400 baud modem board.

Wroks great in all modes, $100 shipped.

I could hardly agree more. I quit trying to enjoy ham radio in 1987.
Between 1973, when I became a ham, and 1987, when I packed away my
equipment. I think I had maybe 5 interesting conversations on ham radio.
The absolute, unvarying banality of ham conversation on both the low bands
and two meters never ceased to amaze me. These were presumably intelligent
people! They couldn't successfully pursue such an advanced technological
hobby if they werent! Yet they were as incapable of speaking intelligently
with each other on topics other than their health or their rigs, or of
exercising even the minimum imagination necessary to make human contact
with foreigners, as if they were children--or CBers. It took me years to
understand that this limitation was really an integral part of the ham
experience (I'm a slow learner.) Once I did understand this, I switched to
computers and then the internet, where usenet makes possible occasional
thoughtful and interesting exchanges (in between the cancerously-spreading

sex ads).

> by way of advancement.

In its early days, NOS underwent a tremendous amount of code development and so the community that used it saw very vibrant progress. It's only in the last half decade that development came to a relative standstill, primarily for two reasons: (i) the DOS memory limit, and (ii) poor integration of NOS's monolithic program with the operating systems under which it ran. Both of these are total show stoppers in the end, despite brave attempts by many to overcome the problems. It did a good job in its day, but that era is long gone.

> If Greg was right (and I'm not saying he was) then the idea
> has been fairly tested - and it failed miserably.

He's wrong. He should look to GNU and Linux, BSD, etc, and see that the idea is not only working magnificently, but has yielded quite probably the leading development platform of these times.

And, as it happens, that platform is also the replacement for NOS, since it has everything that NOS had and 10000% more already built into it. As a result, the stoppers on software development have once again been removed at the computer end, which is very good news. Even better though, because both Linux + BSD and the various commercial personal operating systems already have all the TCP/IP infrastructure built in, it means that radio amateurs can dispense with tinkering at the higher layers of networking and instead concentrate on drivers and lower layers that interface to any special RF comms hardware we might create. Wow, this even gives us the time to build new radio gear now --- how radical! :-)

Seriously, a new period of rapid development is upon us again. TCP/IP provides the integration glue, the Internet provides a massive resource of information and people, and the free Unixes provide a superlative platform, so if we pull our fingers out the world should be our oyster. Let's go for it.

Rich.

Well that's a big question. Diplexer / cavity tuning is a bit of a black art .. I remember a bit of RSGB book I think it was micro wave handbook covers it a little. The quote was something like " In professional circles it is common practice (by those who should know better) to couple a filter to a network analyser and twiddle around until the required result is obtained" So provide you have a network analyser you could have a go at that. Last year I spent some time in two Local companies (In Aylesbury Bucks) tuning 1800Mhz cell phone base duplexes. Com-Dev and Airtech I do not work there anymore but the experience was interesting. Com Dev took training seriously where as Airtech just get people off the dole queue let them lose and if they managed to tune them that was that. However Back to your problem Asuming you can get use of a network analyser the next unknown is will the filter tune down to 430 MHz. Lets assume yes Then start by checking out the diplexer as it is and identify the pass bands (insertion loss) and return loss though each half. Now it is difficult with out knowing a bit more about the diplexer in terms of number of cavities and other things that could be in there (poles, cross couplings) so assuming its a simple three cavity per leg. How is the tuning done (screws with locking nuts?) the main tip of the trade is if one has to "move" a filter then for moving down . start at one end and tune each screw (inwards for lower freq.) just a little but each one the exact same amount (physically) if done right the passband after you tuned them all the trace will be similar but shifted down. the point is that you do this blind (not watching the trace as for instance the first screw might disrupt the display all over but the next might correct a bit. Repeat the cycle just moving the screws a tiny amount each run though. The interaction between the cavities is a problem, What you must do is move the lower side down a little then the other side down the same amount IMPORTANT to keep each leg at the same spacing i.e. do not let any of the upper frequency pass band cavities "Cross in to the lower frequency side"
The diplexer will most likely have been set up covering a band of frequencies in commercial use You have just spot frequencies in mind That may be an advantage however due to interaction you may find it impossible to set all the cavities spot on as when the close in it all goes pear shaped!!
It may be that you might have to start the tuning from scratch. So a rough guide would be first to rough tune each leg so that by watching insertion loss try to position each cavity peak to where it should be. then by watching the return loss tune for the maximum loss, You need

to identify the correct number of peaks (dips) in the band, by
watching the return loss as you tune each screw the display will alter
but not as you might expect, The main mistake is trying to get it
right by concentrating on a particular screw, The adjustment should be
very small on each one moving on to the next in order then repeating
not going back and forth between two! i.e. 1-2-3-4-5-1-2-3-4-5
-1-2-3-4-5
the return loss will drop as you experiment you will see that one
screw may push two dips down one up, another may push dips 1 and 4 up
2 and 3 down one may tend to see saw the dips, by careful manipulation
with all the variation's one can over time develop a skill in the sort
of Magic trick(Pick a dip and increase the return loss at that
frequency. I must stress the necessity to constantly be checking both
legs and gradually homing in. All ports must be loaded (50ohms) at all
times.

AIUI, what you want to do is simultaneously operate
two independent *transceivers* on different frequencies
into the same antenna.

This is not quite the same thing as commercial duplexers are
designed to do.

What you appear to want is a 3-port device that will:

Couple power from port 1 to port 3 at frequency A whilst
isolating port 1 from port 2 at the same frequency.

Couple power from port 2 to port 3 at frequency B whilst
isolating port 2 from port 1 at the same frequency.

Couple power from port 3 to port 1 at frequency A whilst
isolating port 3 from port 2 at the same frequency.

Couple power from port 3 to port 2 at frequency B whilst
isolating port 3 from port 1 at the same frequency.

What you have there is a 3-port device that should, if it
is a well-designed duplexer:

Couple power from port 1 (TX) to port 3 (antenna) at
frequency A whilst isolating port 1 from port 2 (RX) at that
frequency.

Couple power from port 3 (Antenna) to port 2 (RX) at
frequency B whilst isolating port 3 from port 1 (TX) at that
frequency.

In addition, isolate port 1 from port 2 at frequency
B, in order to keep transmitter-generated noise
out of the receiver.

The two are not quite the same thing.

There are many different ways of designing duplexers
to achieve these results. Good ones use various
combinations of bandpass and notch functions, and
may or may not be reconfigurable to do what you
want. In any case, the required change in frequency
will probably involve not just retuning, but physical
alterations to both the resonators and the coupling
lines between them, unless you can put up with high
insertion loss and a soggy response.

If you can get hold of some combiner system cavities,
that would a much better way to do it. They're big,
though. Some are actually made from aluminium beer
kegs!

Hello
I'll hope there is somebody out there who can help me
with following error: DRSI MAX LOOP HIT
I'am using PacketCluster v.5.0 form
Pavillion software (no BPQ)..
When this error come DXCluster PC stops, and
the PC is not responding form keyborad.
PC power down and up is the only way
to start DXCluster.

Pse help

Yes, people do make contacts using GTOR, but to be honest I have only made less
than a dozen, and most of those started off as Pactor then we decided to
re-link using GTOR.
I have tried calling CQ several times in GTOR, but it is not the thing just
yet.

Hi Ron,
TNC-3 is a german ham product based on Motorola 68302
microprocessor. I've heard that it's really cheap, less
than 200$, and that it works fine.
I don't know more, so I ask to the german hams to point us
to a good reference source.

Take a look at http://web.avo.net/infracom, click on the English flag
then navigate in the packet-radio section : Infracom distributes the
TNC3 and other similar products in France and around the world, such
as YAM (a very cheap 9k6 Italian COM-port modem), A 9600 Baud Handbook
(with all modifications translated into English), etc.

I hope you'll find all information you need.

73,

E. BERTREM

I have a Motorola SP50 UHF Radio used only 5 times in Brand Spankin' New Condition with antenna, full capacity Nicad pack & drop-in rapid charger. This is a two channel radio and will transmit from about 400mhz to 470' something mhz. The radio is about 1 year old if that and is a full powered radio with the option button programmed for low powered 1 watt setting when full power is not needed.

No reasonable offer will be refused.

I would be willing to trade it for a Yaesu FT50R, ICOM 706MarkII or any HF base radio that is is either last years model or current model.

Remove the 'X' from my EMAIL address to reply. Send all offers to me in email: xandrew@tropicom.net

Did it ever occur to you that it takes two to make a conversation? It's not new to bow out whenever the content of the exchange gets so light as to be uninteresting, but I've frequently been surprised what a seemingly unrelated comment by me brought out of the other party and what interesting "threads" it sometimes led to. Frequently other hams join in who were just monitoring when the interesting stuff started, and who now find reason to join in.the proceedings. This frequently leads to extensive roundtables that go on for some time, interesting all the way, on most any subject you could think of. Don't blame ham radio for your own shortcomings as a conversationalist.

One of the most interesting on-the-air groups I get into is headed up by a fellow who is a wheelchair quadriplegic, has very limited usage of his upper extrremities and still builds amplifiers and tuners. He is also an accomplished machinist and gunsmith, and is knowledgable in a wide variety of subjects. Throw a comment out for this crew and it draws anything but dull responses....There are a lot more people like that on tha air than you evidently could imagine.

I've had considerable higher amount of interesting QSO's, several QSO's
with LA7MI or LA6VM on 80/40m ssb lasted over 5 hours, I might even had
many interesting 2m FM QSO's, even some on repeaters!!!

>Conversation is a two-way street. If you have nothing to offer, chances are
>you will get nothing in return. It's that simple.

it is perhaps not too difficult to find somebody to make an interesting
conversation with, the problem is all the breakers (read: Intruders),
interrupting an interesting conversation without having anything to add
to the discussion. I usually overhear intruders, but unfortunately the
opposite stns does not.

Still remember a G-stn I worked on 144320 some 20 years ago, we had so
much to talk about, but so many angry stns waiting to work to LA

The problem is that Kantronics defined the FEC mode for G-tor to be Amtor FEC. If you set you KAM to G-tor and call CQ, you will be calling in Amtor FEC. Now ask yourself, when was the last time you tuned for a CQ listening in Amtor FEC?

The solution is simple.

Make your CQ call in Pactor FEC. In your CQ text, mention that you are looking for a response in G-tor, Pactor or Amtor modes (in that order). Then be sure to switch to Tor-standby as soon as you complete your CQ call. You'd be surprised how many G-tor calls you will get that way!

BTW, the KaWin CQ Robot will call CQ in either Pactor FEC or Amtor FEC and switch your Kam automatically to Tor-standby after each CQ call, making this a completely painless procedure. KaWin is available from http://www.sni.net/kawin/

Message-ID: <Ers9pC.BK2@linux-os.demon.co.uk>
Source record: 24409

I am after a scrap Receiver board from a MX294 synthesized radio.The radio
Is a band E radio 68-88 mhz.

I have damaged the Fm discriminator core on mine which I think Is labled
L12.
The receiver board Is labled AT28873 which Is the later version but AFAIK
the only diff between the older RX borad Is the Transisor types on the front
end.

I'd say you were unlucky, I've been licensed since 1965, built many pieces of
equipment, synthesized multiband transceivers, test equipment like a spectrum
analyser module and the like. I never owned a commercial rig until 1992 when I
saw them at a price Stateside that was hard to pass up on.
Over the years I've had skeds with many parts of the world, seen a few of those
I worked when on my travels. I even had a good long chat with the skipper of a
Varig 737 flying between the Capital of Amazonas State and Recife. It depends on
what interests you have, I enjoy chats on general things, airplanes (sexiest
things on 3 legs), radio and lots more, I shun the computer chats except with
people I know, the ones who will go on about how wonderful Windoze XX is and
it's outstanding packet software, poor blokes salivating over Microdro$$
operating systems.
Anyway, got a CT-2 to fix and get packet back on the air and if it stops
raining, get drilling a wall to pur that 2m antenna up above the roof.
One day soon I hope we can make the jump to 56K packet and shift some real
stuff, we keep moving an inch at a time modifying ex-PMR stuff, but think we
need to build from scratch.
Regards

Message-ID: <1998042205131900.BAA28023@ladder03.news.aol.com>
Source record: 24412

We have written a Toroid software package for use DC to 300 MHz. Many Years of research has gone into error corrections for the low perm cores , 200 & 360 degree coverage as well as SRF for series and shunt coils. Much of this has come about as a request from Micrometals. The pin point accuracy allows us to add a custom core feature for custom shaped cores, stacking cores side by side and machining custom phenolic cores from plastic, teflon, wood, ect...

That's because you failed to ask the right questions - you failed to show the other operators you were interested in conversing with them. Did you ask about their military experience? Did you ask if they had any patents? Their profession? What books they'd recently read? Their thoughts regarding solar or steam power? Chess? Did you try to learn *anything* from and/or about the other fellows? Once you find the what the other person is interested in, you'll gain quite a bit of knowledge in an area that you possibly knew nothing about prior to the QSO.

Look for a speciality net to check into, such as the old Astro-Net which used to be on 3885 kc - amateur astronomers in their backyards all peering at the same celestial body through their telescopes (with a name like Moonman, you would have fit right in...). Call CQ CHESS to hook up with another chess player. Turn down your power to say, 1 W, and try for the Thousand Mile Per Watt award (or the 10,000 MPW award).

Geez, the list is endless. Your problem is that you have no imagination! It's no wonder your QSOs appeared so boring to you; I can imagine how the other fellow felt!

Bob,

Since the Kantronics products are not true TAPR TNC-2 clones, you cannot do either. They do sell a set of firmware they call K-Net however, which closely resembles the features available with the X-1J firmware.

http://www.kantronics.com/ For their homepage.

http://www.kantronics.com/specs/knet.htm For more info about their networking firmware.

The answer is really yes and no. There are stations operating gateways
that can receive internet mail and you can use a mode like pactor or
pactor II to pick up the mail. The May 1998 issue of QST details one
such possibility, however forwarding mail is rife with risk if there is
no filtering mechanism (consider how much spam you can get), so
anyone operating a gateway probably has to do a lot of checking of
the contents before putting her or his station at risk.

Hello,

I think the best description for a TNC-3 with the Knet firmware
installed is, that hat a Knet equipped TNC-3 is compatable with an
existing network that uses the X1J firmware. It doesn't contain all
the features of the x1j. This isn't to say the Knet isn't usefull. I
use it one the PVL, (KS), node. It's one of those temporary patches that
seems be pernament.

Howdy, Will!

If you already have a SoundBlaster (or clone), then you can get on the air for less than five dollars worth of parts (for a serial port PTT (Rig Keyer) interface. One transistor, one resistor, one diode. The software to handle the DSP for the soundcard is a driver written for FlexNet. So, while you will be running the cheapest packet TNC setup around, you will also be running the most advanced and sophisticated.

I'm using a SoundBlaster with FlexNet and the whole software package easily fits on a "boot" floppy. The only TNC parameter you supply is TXD (Transmit Delay) and FlexNet handles all the rest. For this reason, FlexNet is really easy to set up and get running. You get a simple term program with it, but it also runs with BBS and DX Cluster software if that interests you, later on.

FlexNet dynamically adjusts PACLEN, FRACK, MAXFRAME, PPERSIST, and other TNC parameters most of us would rather not have to bother with. It adjusts them on the fly, for each individual connection, even on the same radio port. If it link is good, it soon opens up it's parameters like a hose. If the link deteriorates or gets busy, FlexNet backs off on the parameters just enough to eliminate Rejects and resends. No other packet software is this advanced. It's fun to watch.

When I switched from G8BPQ to FlexNet, I got better performance out of the same old radios and antennas. - An actual increase in the usable range and throughput. (Not much, but the difference was there.) I can only attribute this to FlexNet's adaptive TNC parameters, which are not stuck at some compromise setting like those of my BPQ node.

It works with BayComs, too. It works with TNC2's, but only with the SIXPACK software installed in the TNC's EPROM. The FlexNet folks supply the EPROM image, and you dig up somebody to "burn" it onto a chip for you. Running SIXPACK, you can stack up to eight 1200 bd TNC2's on one (fast) Com port. - Or less of them if they are for higher baud rates.

For more info, check out the article on FlexNet at the URL below, and follow the links provided there.

Charles,

I just got PC/FlexNet up and running, and my interface built.
However, this is my very first experience with packet radio, and I
simply don't know what to do or type once the program is up and
running.

I'm using the BCT (BayCommTerminal emulation) program that comes with
the PC/FlexNet package. The documentation that I have is written in
German, so I can't read it.

I have verified that I am transmitting packets by listening on another
receiver.

RTTY
==========
The Internet continues to amaze me! I have found
another really neat computer program that uses a
PC's SoundBlaster card to encode/decode RTTY.

The program is called Blaster TeLetype -
BTL Version 1.51 by Rob Glassey
And, this version is completely free!

The interface cables can be assembled in less than
an hour, and for less than $7.00 with parts available
at RadioShack. Instructions for the cables are in
the on-line help of the program on page 7 & 8.

<A quote from the author:>
"This program is being released as free software for
non-commercial and non-government purposes in the spirit
of Ham Radio to encourage people to take the plunge into
the fascinating world of digital radio with no need to
buy expensive data modems. And with no compromise in
performance either. In my tests BTL easily matches, and
even exceeds the performance of my expensive analogue modem."
<end quote>

I had not seriously considered the digital modes simply
because of the cost of the equipment to 'buy, then try'.
Now, BTL has made RTTY a reachable mode for my budget.

BTL has a home page on the Internet at the address:
http://www.geocities.com/SiliconValley/Heights/4477/
Author's e-mail: robglassey@geocities.com

PACKET RADIO
==========
This is interesting!

Packet radio using a sound card - No TNC needed !!!
Source:

http://www.geocities.com/CapeCanaveral/Hangar/1632/flexnet.html

The software that lets you do this is called PC/Flexnet. Rather than
try to explain the software myself, you are better served if you go to
the official homepage of the Flexnet group in Germany. "
http://dl0td.afthd.th-darmstadt.de/~flexnet/

Here is how I got started--

First, I read the introductory document at:
http://www.geocities.com/CapeCanaveral/Hangar/1632/flexnet.html

Then, I followed the basic instuctions for Windows 95 at:
http://www.geocities.com/CapeCanaveral/Hangar/1632/basicpkt.html
to get the software downloaded and installed. Follow the instuctions
to start the Baycomm style terminal.

Here is the simple interface circuit that I built for my RadioShack
HTX-202:
ftp://207.101.122.143/c/ftp/hamradio/Software/PacketRadio/FlexNet/Win95/PTTinterface.txt

Other circuits can be found at:
http://dl0td.afthd.th-darmstadt.de/~flexnet/ptt.htm

Ref the Cheap and most efficient way into packet radio is a
Commodore128 computer.
A A&A engineering TNC (Modem) kit.
The famous DIGICOM software from Germany (Public Domain)
(Same people that wrote the later IBM stuff "PACOMM")
(used with BAYCOM TNC)
The Commodore way is the only way. No worry about VIRUS',
Hard Disks that crash in the night.
Flakey hardware that may run most days of the week except on Holidays
and weekends et Al
Joe (aka kilroy)

Try Jameco or JDR. TCM3105s have been out of production for a while now
and are getting pretty scarce. You're probably left with the alternatives
of buying a Baycom modem from Tigertronics or PacComm or looking for a
used TNC. Figure on $50 or more either way. On the other hand, there is
plenty of good freeware software around, so you can save on that end.

If you have an old soundblaster card laying around, that is another
possibility.

Bob

As Charles Brabham mentioned, the cheapest way if you have a
computer with a compatible soundcard is to use Flexnet, or if you
for some reason can't use Flexnet, last I knew, JDR Microdevices still
has the TCM-3105 if you have the standard diagram for a baycom
modem. I note however that there are 9600 baud versions supposedly
available (to be honest, I've never seen one, but they're supposed to
be out there on the net). I had trouble getting Flexnet to run with
my ancient soundcard at first, but I eventually got it up and running,
and it was more reliable than using a baycom modem with JNOS
or some similar solution.

>I need more com-ports to connect to my 9k6 modems
>Is it possible to use the USB-port? Is there a converter to convert
>com-serial-signals to USB?
>

Yes you can use the USB to generate more serial and parallel ports, but the
price is
very high! Go to http://www.usb.org where there are links to makers of USB
devices. These include USB to multiple serial ports. You need Win95
release OSR2,
which you would only have if you purchased your computer recently. You can
verify
this by going to Settings-Control Panel-System to see your OS revision. If
it says
4.00.950a you are out of luck. You need 4.00.950b for USB. When Win98
comes out
USB support will be standard.

So there is hope, but its a way off as yet, and right now the prices are
awful!

Perhaps in a year the situation will be brighter.

Ron

WinPack V6.4 is now available, see http://www.peaksys.demon.co.uk.

One of the major new features in V6.4 is support for the SV2AGW Packet
Engine. This mean that WinPack now supports:-

1. TNCs in terminal mode.
2. BPQ.
3. WA8DED and TF host mode.
4. PC Flexnet.
5. SV2AGW Packet Engine.

Like to play with electronics and PC's ?

This is for you.....

Control eight separate relays with your PC printer port !

Each individually programmable in Windows 32 bit environment.

Choose "Timed" Mode or "Interval" Mode.Infinetly variable.

Only four components per channel are needed.

Opto-isolated to protect your PC from "mistakes"

Full "WIN 95" style help files and construction details with graphics.

Convert the printer port into "Read" mode for A/D converter with one push
of a button.

Analog to digital converter plans and circuit.

You can download just the help files with construction details
or the full package inc. the help files.

NOTE: 32 bit Windows version ONLY.

Point your browser to:

1986. cheap way to connect two computers with radio?

Newsgroup: rec.radio.amateur.digital.misc

Source record: 24358

My friend and I live approxiametly 3.5 miles away from each other. It would be immensly useful to use to be able to transfer data between our two computers without using the phone lines. I've been looking around at some radio stuff and I noticed wireless LAN networks are way to expensive. Is there a cheap way to connect our computers (e.g. under $500) and still get a decent transmission rate?

There are lots of high-speed Local and Metropolitan Area Networks around now (I seem to recall several listed a couple of links off the ARRL or TAPR websites), but the state-of-the-art in country-wide amateur data networking is in Slovenia --- check out the map of the Slovenian network at:

http://www.hamradio.si/prmap.html

To summarize it, they have an extensive system of 1.2Mbps network links on 13 and 23cm and their main user-access links run at 76.8 Kbps. There's also an Internet gateway attached to it.

Rich.

There are several. You need to put the kpc3 in KISS mode.

Check out pc.usl.edu for JNOS 1.11b.

I don't understand the part about not needing an IP. Were you referring
to an IP address? You'll need it to run tcp/ip. According to the
callsign database, you are in Michigan. Contact one of the following:

44.092/18 USA:Wisconsin, up pen Michigan N9UDL Thomas Landmann
44.102/18 USA:Michigan (west lower pen) N8WKM Dan Thompson

>Is there a TCP/IP program that will work with the KPC-3+...also how would
>you configure it so you dontr need an IP

Yes, the KPC-3 will go into kiss mode and function as a 1200 baud
kiss modem and get controlled by JNOS, TNOS, MFNOS, Flexnet, or
the SV2AGW programs if said programs are configured properly.

Part of your question didn't make it through, if you're asking how to get
one of them to function without an ip address, you're probably asking for
a lot of trouble, and going to the trouble of disabling most of the features
of a standalone TNC like the KPC-3+ for no reason. The two commands
to put it into Kiss mode are

Interface Kiss
Reset.

If you're using one of the NOS programs the way to get out of Kiss mode
is param <port name> 255

You get to pick out the <port name>.

Also the following sequence using the numeric keypad on an MSdos
compatible computer will work from a terminal program if the
terminal program is set to the proper baud rate to match the TNC

<ALT>192
<ALT>255
<ALT>192
release the <ALT> key in between entering 192, then 255, then 192.

There is an IP coordinator available wherever you live, and you can be
assigned an amateur IP address or two if you need one, and also learn
about folks around you, and yes, you can use a program like JNOS
without being hooked up to other folks running tcp/ip, but unless you
want to run a bbs, there is no real reason to not just use a packet
terminal program.

***** DON'T PANIC!!!! *****

***** READ ENTIRE MESSAGE FIRST!!!! *****

The following message is an announcement of a 30-day discussion period on news.groups to precede a non-binding opinion poll which, depending on the results, MAY lead to a formal Request for Discussion (RFD) to reorganize the rec.radio.amateur.* newsgroups. NO VOTES ARE BEING TAKEN AT THIS TIME, and any binding vote that affects the rec.radio.amateur.* newsgroups will not occur for many months into the future, if at all. Please read the entire announcement carefully before replying or following up.

rec.radio.amateur.* Vote of Confidence

Contents:

Q: Who is doing this?
Q: How may I join the rra-wg?
Q: Why are we doing this?
Q: What are we doing?
Q: More to the point, why are we "kicking over this hornet's nest?"
Q: Why do you want to change the newsgroups again?
Q: Who are you to tell us what to do with "our" newsgroup?
Q: How long ago were each of the rec.radio.amateur.* newsgroups created?
Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and rec.radio.swap included in this proposed opinion poll?
Q: Where can I obtain a copy of the original newsgroup charters?
Q: Where can I find out more information about the Usenet RFD/CFV process?
Q: I don't want any of the newsgroups to change. What should I do?
Q: I want to go back to one single newsgroup for amateur radio on Usenet, like we had back in the 1980's. What should I do?
Q: I support some of the newsgroups for amateur radio, but not others. What should I do?
Q: I support the existence of a newsgroup, but disagree with its charter. How should I vote?
Q: I would like new newsgroups to be created, what should I do?
Q: I have no opinion, what should I do?

Q: Who is doing this?

The rec.radio.amateur.* Working Group (rra-wg@theporch.com, which initiated the last major reorganization in 1993) is the point-of-contact

for questions about this proposed opinion poll. Principal members are Paul W. Schleck, K3FU, and Jeffrey Herman, KH2PZ. Though not an rra-wg member, Gary Coffman, KE4ZV, also endorses this proposed opinion poll. The proposed opinion poll will be conducted by an unbiased third party from the Usenet Volunteer Votetakers (UVV), Jeremy Billones (billones@primenet.com).

Q: How may I join the rra-wg?

Anyone who volunteers may join the rra-wg. The rra-wg has always solicited volunteers from when it was created in 1993 (originally named rra-reorg) to draft an RFD to reorganize the rec.radio.amateur.* newsgroups (and continues to serve as an advisory group for FAQ maintainers and new newsgroup proponents). You may join the rra-wg by subscribing to its mailing list.

The automated list manager address is

listproc@theporch.com

Use this for subscribing, unsubscribing, getting archived info, getting the FAQ message, changing your address, etc.

To subscribe, send a message to this address with "subscribe rra-wg <your name>" Similarly, to unsubscribe, replace "subscribe" with "unsubscribe"

The list owner address is

listown@jackatak.theporch.com

Use this address only when there is a problem which really truly can't be resolved otherwise.

Q: Why are we doing this?

Discussion on the rec.radio.amateur.* newsgroups shows that there is a difference of opinion about the current newsgroups and their charters. Assertions on one side of the argument that the charters were voted upon by the readers have been countered with assertions on the other side that the votes took place years ago, by a very small minority of the current readership. There is also the strongly-held opinion among some that we have "too many newsgroups." The following is a sample posting from the discussion thread on rec.radio.amateur.misc that led to this proposed opinion poll (the entire thread may be viewed at DejaNews, http://www.dejanews.com/):

Q: What are we doing?

As a preliminary (and perhaps even diverting) step to an RFD (which would be very laborous and time-consuming, and perhaps unnecessary), we propose to conduct a Straw Poll, or "Vote of Confidence" (similar to the vote of confidence for a Prime Minister made by British Parliament, or a non-binding resolution of the U.S. Congress). We do it Usenet-vote style (utilizing a neutral vote-taker from the UVV) with an RFD and Call For Votes (CFV) period. During the RFD, we have discussion pro and con about each newsgroup and its charter. During the CFV, a vote is taken where a "Vote of Confidence" yeah or nay for each newsgroup, as currently constituted and chartered, is given by each voter (YES/NO/CANCEL/ABSTAIN votes are valid).

What votes mean:

YES: I support the existence of this newsgroup and its charter

NO: I believe that this newsgroup's existence or its charter should be reconsidered in a future RFD/CFV

CANCEL: Delete any previous votes I made concerning this newsgroup

ABSTAIN: I have no opinion concerning this newsgroup

Each newsgroup that does not pass a vote of confidence by Usenet voting standards (2/3 and 100 vote majority of YES versus NO votes) may be referred to the Usenet newsgroup creation process where their deletion or modification (based on a rough consensus of the 30 days of discussion and how much they lost in the vote of confidence) is proposed. Each newsgroup that does pass a vote of confidence will have its charter, and justification for existence, reinforced to the readership (as the current readership voted on it).

Q: More to the point, why are we "kicking over this hornet's nest?"

Sometimes hornet's nests can get big enough that they wind up falling down anyway. As shown in the thread above, there are significant undercurrents of disagreement over the current newsgroups, their charters, and even the suggested guidelines and rules of net-etiquette that many on the newsgroups advocate. If the proposed opinion poll shows strong agreement with current practices, then that would help reduce (though not eliminate) newsgroup arguments on the subject. If, however, the proposed opinion poll shows strong disagreement, then it's probably better that we know that right away, and take steps to fix the current situation before it degrades any further.

Q: Why do you want to change the newsgroups again?

Only some of the proponents of this proposed opinion poll wish to change the newsgroups. Some wish to simply have the current newsgroups and their charters reinforced. All of the proponents agree that an up-to-date opinion poll of the readership is desirable at this time. Whatever future actions will be taken will be determined by the results of this proposed opinion poll.

Q: Who are you to tell us what to do with "our" newsgroup?

One answer is that on Usenet, no one "owns" an unmoderated newsgroup. Newsgroups are voted into existence by a democratic process to determine consensus (and lack of significant objection) for using shared network resources to support them. All of the existing rec.radio.amateur.* newsgroups passed such a vote at some time in the past, and should pass such a vote again if there is strong support for their continued existence.

Another answer is that this is just a non-binding opinion poll of the readership to determine a consensus, if any, for making changes. It would still be necessary to undertake a formal RFD/CFV process to change any Usenet newsgroup (and that was always possible, anyway).

It should also be emphasized here that no individual rec.radio.amateur.* newsgroup is being singled out. Rather, a consensus of the readership concerning ALL rec.radio.amateur.* newsgroups is being sought.

Q: How long ago were each of the rec.radio.amateur.* newsgroups created?

1972 (or possibly earlier, this date is when UCSD joined the ARPANet):

Info-Hams (original ARPANet mailing list at Simtel-20, continues today
at UCSD as a gateway of rec.radio.amateur.misc)

1979:

Creation of Usenet News at Duke and UNC

early 1980's:

fa.info-hams (fa = "From ARPANet") *
net.ham-radio (pre-Kent Paul Dolan "Great Renaming") *

mid 1980's-1991:

rec.ham-radio *
rec.ham-radio.packet *
rec.ham-radio.swap *

1991 Reorganization:

rec.radio.amateur.misc
rec.radio.amateur.packet *
rec.radio.amateur.policy
rec.radio.cb
rec.radio.swap

1992/3 Addition:

rec.radio.info

1993 Reorganization:

rec.radio.amateur.antenna
rec.radio.amateur.digital.misc
rec.radio.amateur.equipment
rec.radio.amateur.homebrew
rec.radio.amateur.misc
rec.radio.amateur.policy
rec.radio.amateur.space

1996 Additions:

rec.radio.amateur.dx
rec.radio.amateur.boatanchors

* = obsolete

Current newsgroups covered by this proposed opinion poll, and the years
in which they were created:

rec.radio.amateur.antenna (1993)
rec.radio.amateur.boatanchors (1996)
rec.radio.amateur.digital.misc (1993)
rec.radio.amateur.dx (1996)
rec.radio.amateur.equipment (1993)
rec.radio.amateur.homebrew (1993)
rec.radio.amateur.misc (1991)

rec.radio.amateur.policy (1991)
rec.radio.amateur.space (1993)
rec.radio.info (1992/3)
rec.radio.swap (1991)

Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and rec.radio.swap included in this proposed opinion poll?

Though one level up in the rec.* hierarchy, these newsgroups are principally used by readers of rec.radio.amateur.*, and their fates would substantially be decided by any significant reorganization of the rec.radio.amateur.* newsgroups. Though created by a rec.radio.amateur.* reorganization, rec.radio.cb is not included in this proposed opinion poll.

This announcement has been cross-posted to all rec.radio.* newsgroups (except for rec.radio.broadcasting and rec.radio.info, which are moderated). In addition, the following individuals were consulted prior to this announcement (note that consultation does not necessarily imply endorsement):

Richard Eckman, KO4MR, Proponent of rec.radio.amateur.dx
Brian Kantor, WB6CYT, Administrator of Info-Hams/Ham-* mailing list gateways of rec.radio.amateur.* newsgroups at UCSD
Ian Kluft, KO6YQ, Proponent of 1993 rec.radio.amateur.* reorganization, former rec.radio.amateur.* FAQ Maintainer
Jay Maynard, K5ZC, Proponent of 1991 rec.radio.amateur.* reorganization
Brian Short, K7ON, Moderator of rec.radio.info
Rick Stealey, K2XT, Proponent of rec.radio.amateur.boatanchors

Q: Where can I obtain a copy of the original newsgroup charters?

ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.info
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur-reorg
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.dx
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.boatanchors

Q: Where can I find out more information about the Usenet RFD/CFV process?

ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Create_a_New_Usenet_Newsgroup
ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Format_and_Submit_a_New_Group_Proposal
ftp://rtfm.mit.edu/pub/usenet/news.groups/Guidelines_on_Usenet_Newsgroup_Names

Q: I don't want any of the newsgroups to change. What should I do?

Express your opinions on news.groups (the default followup newsgroup for this message) and vote "YES" for all of the existing rec.radio.amateur.* newsgroups when the proposed opinion poll occurs (in 30 days time).

Q: I want to go back to one single newsgroup for amateur radio on Usenet, like we had back in the 1980's. What should I do?

Express your opinions on news.groups, and vote "NO" for all (or all but one) of the newsgroups when the proposed opinion poll occurs.

Q: I support some of the newsgroups for amateur radio, but not others. What should I do?

Express your opinions on news.groups, vote "YES" for any newsgroups that you wish to remain unchanged, and vote "NO" for any newsgroup you wish to have reconsidered in a future RFD/CFV when the proposed opinion poll occurs.

Q: I support the existence of a newsgroup, but disagree with its charter. How should I vote?

Since the proposed opinion poll is for both the existence of given newsgroups AND their current charters, you should express your opinions on news.groups and vote "NO" for that newsgroup when the proposed opinion poll occurs. Again, this is a non-binding opinion poll simply to determine if current newsgroups should be considered for modification or deletion, not a vote to actually modify or delete these newsgroups.

Q: I would like new newsgroups to be created, what should I do?

Creation of new newsgroups is not being considered by this proposed opinion poll. A future RFD/CFV would have to be initiated to do this. You are, of course, welcome to express your opinions concerning new newsgroups on news.groups.

Q: I have no opinion, what should I do?

You may wish to read the following 30 days of public discussion on news.groups about this proposed opinion poll to develop your own opinions. Discussing your resulting opinions on news.groups may help further develop your opinions, or those of others.

If, after reading and participating in the public discussion, you still remain undecided, you may choose to abstain from the proposed opinion poll. You may do so informally by not participating in it at all, or formally by explicitly voting "ABSTAIN" for all of the newsgroups when the proposed opinion poll occurs.

Watch for an announcement of the STRAW POLL (CFV) in about 30 days. Questions to rra-wg@theporch.com.

1999. HF BBS Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-26 00:00:00 UTC
From: wjlukits@execpc.com
Message-ID: <6i0sj5$8r7@newsops.execpc.com>

2000. Packet Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-27 00:00:00 UTC
From: l33863@alfa.ist.utl.pt
Message-ID: <6i1rg5esc2@ci.ist.utl.pt>
Source record: 24277

Hello.
I'm moving on to packet radio.
I need a modem. Saw some docs on the web about the
Baycom 1200bps modem.

I have own "normal" modems for some years. The first
I had was 2400bps, in a time where the highest speed
was 9600bps. Things have changed and know, transfer
speeds just keep getting higher and higher, althought
the telephone lines have a bandwith limit.

So, since I don't feel like going back to 1980, and
use a 1200bps modem, where are some questions:

- Is there a FAQ on packet radio? I have looked but
couln't find it. :-(
If you have one, please mail it to me. If you know
where I can find one, please let me know the web
adress.
- How fast can a packet radio modem go in bps?
- I wish to build my own. What model should I use?
Where can I find the schematics?
- What "make it yourself" models are people using?

Thanks for your time,

JL

PS: I'm using a President Lincoln. Maybe this is
important when it's time to choose a modem.

2001. Packet with a Palmtop

I am seeking advice on how I might use my Sharp Zaurus ZR5800 as a VHF/UHF packet terminal. The Zaurus has an RS232 compaitble serial port and a terminal emulator program the can handle TTY and VT100 emulations. I don't know very much about TNC's. Would it be possible to use a TNC or Baycom modem with the terminal emulator in my Zaurus? Thanks for you time.

2002. CORRECTION: Send STRAW POLL Discussion to rec.radio.amateur.misc

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-27 00:00:00 UTC
From: pschleck@novia.net
Message-ID: <6i32lhioj1@newscene.newscene.com>
Source record: 24279
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment

Based on thoughtful feedback from Kathy Pascoe (kpascoe@ford.com) and Yves Belleveuille (yan@storm.ca) on news.groups, I've come to the conclusion that rec.radio.amateur.misc would be a better followup target for this straw poll discussion.

I sent the original copy (complete with exact headers) to several experts, including past newsgroup proponents and our volunteer UVV votetaker for review a week prior to posting, but unfortunately no one (including me) noticed that a followup to news.groups might generate controversy. As helpful as the standard FAQ documents on newsgroup creation were, they weren't (in my opinion, at least) sufficiently clear regarding the inadvisability of conducting informal meta-discussion on news.groups. It's also sometimes hard to figure out what's appropriate on what newsgroup by observing others. According to Kathy and Yves, news.groups is an appropriate target for discussion in response to a formal Usenet Request for Discussion (RFD), but informal pre-RFD discussion (including straw polls) should probably be conducted in an appropriate home newsgroup.

Since more than one person has offered this feedback, and in a thoughtful and convincing manner, I'm posting this correction, and asking that followup discussion on this straw poll (which should commence, as scheduled, in 30 days time), go to rec.radio.amateur.misc.

Hi Conrad,

I use my ZR-5800fx for packet operations while on the road. I opted for the Kantronics KPC-3 TNC running through a Yaesu FT-530 handheld transceiver. The TNC draws very little power, it's self-contained with a PBBS and mailbox. In addition, I can power it from a 9V battery. I use my Zaurus in "terminal mode".

By the way, the Zaurus does *not* have an RS232 compliant port. You need a simple converter, either supplied by Sharp or one of the other vendors. I have both an IR link for printing and for COM port communications (the CE-IR2 and CE-IR-3) and a cable-converter which came with a software package I bought for my Zaurus. Try www.rupp.com for the RS232 interfaces.

I even use the Zaurus to test the PSTN modem link of the Packet BBS system I manage remotely (using the 2400bps "sidecar" fax/tel modem). It's small, easy to carry and works great on 2x AA cells ;-)

Have fun,

Try XPWARE, it seems to run OK with my OK232 and DSP232 TNCs. It's got a
limlited life after which you'll have to pay the $80 fee.

Actually with the rig you name, 1200 baud is about the maximum you can expect. You can't just plug in the equivalent of a phone modem into the radio and expect high baud rates (for one thing duplex operation isn't common, thus at minimum transfer rates have to be cut in half). When you add in things like receivers in radios not acting in a linear or even predictable manner, distortion and the like, your expectations are too high for a "President Lincoln". You can of course find higher baud rates being used in places like Slovenia on bands well outside the reception or transmission range of your present rig. 1200 baud is about as fast as you can expect to work, and frankly, most HF work is concentrating on modes like Pactor, Gtor and the like rather than packet because of an inherent disadvantage packet has on HF bands. If you are going to get on HF packet (I am of course assuming that such operation is legal where you are), then you probably want to drop your speed expectations down to the 300 baud that's common on HF, and be prepared to go for pactor. In fact, if you enter the term "pactor" into a search engine, you should find several web sites with information about that mode.

Good luck ! We have openings in Muncie, only 90 miles away :)

Seriously, this is pretty difficult. 2 years ago, we took a room on a lark,
but we got the LAST room in a hotel
about 40 miles away. It's worth it though, I don't know where you're coming
from, but if you haven't done dayton
before, it's a blast, and you can't bring enough money :)

2021. HF Digital connection to the Internet (e-mail)?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-04-28 00:00:00 UTC
From: Jim Smith <bearami@worldnet.att.net>
Message-ID: <6i5tfg$lmm@bgtnsc03.worldnet.att.net>
Source record: 24294

The article in this months QST about connecting to e-mail via digital HF seem to be an excellent way to stay in-touch with family while traveling in the RV. I have no experience with digital either HF or VHF so I am seeking advice.

Is PACTOR HF a reliable means of communication? Has anyone ever sent e-mail traffic from a HF radio through a gateway station?

I use a Kenwood TS 50 for mobile communications. I intend to buy a Kantronics Plus multi-mode TNC and was wondering how much of a laptop is required to complete the communications package? I assume it must have have a 232 port? How about RAM and a hard drive?

I appreciate any help you can provide. Thanks.

Jim K4PPK

2022. Multi-Mode Data Controllers?

Newsgroup: rec.radio.amateur.digital.misc

Does someone have a list of multi-mode data controllers on the market?
I am looking to run PACTOR, AMTOR and RTTY on HF. I have been looking
at KAM Plus and the MFJ-1278B. Do people feel one is much better than
the other? Is MFJ-1278B/DSP much better then the 1278B?

Some Questions:
Does the MFJ support all the AMTOR modes the KAM Plus does? KAM Plus
supports (ARG, FEC, SELFEC, CCIR 476 & 625).
Do the controllers support listening for all modes on a frequency?

Thanks

Take a look at the HAL P38 board as well. Prices are down and I think you can add clover for about the same money.

Check the ARRL repeater directory. In back they used to list PBBSs and

much more.

The article in this months QST about connecting to e-mail via digital HF seem to be an excellent way to stay in-touch with family while traveling in the RV. I have no experience with digital either HF or VHF so I am seeking advice.

Is PACTOR HF a reliable means of communication? Has anyone ever sent e-mail traffic from a HF radio through a gateway station?

I use a Kenwood TS 50 for mobile communications. I intend to buy a Kantronics Plus multi-mode TNC and was wondering how much of a laptop is required to complete the communications package? I assume it must have have a 232 port? How about RAM and a hard drive?

I was also intriqued, since I'm going on a two week blue water trip in late June with a number of people on a literary mailing list.

I've been poking around a bit, and it looks like connections should be pretty reliable, however, the user computer needs to be a Windows '95 machine in order to use "Airmail", the program that works well with that system. There is no DOS or even Windows 3.1 program that works easily, according to K4CJX. On the other hand, for small amounts of hand entered mail, anything with an RS-232 port and a terminal emulator should work, I think.

The KAM+ seems to work OK, although the new KAM98 might be worth investigating. The Paccomm unit is best, but also twice (or more) the price of the KAM+.

I'd say that a multiband antenna would be a necessity, also, but that depends on propogation.

I'd be very interested in other comments and help. I've not gotten to the point of actually sending email yet, but I have linked to another MBS and to K4CJX's system.

Actually, any software/controller capapble of running Pactor will work. It may not be as convenient as using Airmail. I have used Kagold for the Kam+ and PCPakratt for the PK900 without problems. Find a program that lets you type out a file offline then upload it to the Winlink station. I have a file that explains internet gateways and using HF for e-mail. Let me know and I will e-mail it to you.

Gosh, I'd sure guess it's legal. You're not really encrypting any
secret messages or anything. It's just a signature, not encryption.

Imho, authentication is a good thing. Then everything could be tracked
down to a source. Still, I'm not getting x-rated spam email on packet,
-- one saving grace, the way I am on the Internet so to that extent
things seem relatively under control.

Well, I know answering my own post is bad form, but at least it won't start a flame, hopefully. There's a TCM3105 data sheet at http://www.best.com/~wdunckel/electronics.html but TI has discontinued it. So now I'm wondering if I can use my PC's modem with the Baycom software to make a "TNC-less" packet station? Looking at the Baycom Terminal Diagram you could generate the transceiver's PTT signal from the RTS line of the RS232 serial port, no? yes? Can't you connect a regular modem to your pc via the serial port so the Baycom software would run it?

Trying to get into packet without actually getting in to it.

David,
it was found in an earlier version of the KA9Q, Phil Karn 's TCPIP
package. Unfortunately the US government let him take it out
because it violated US export regulations.
On some servers you still l can find it (don't ask me were because I
don't know it but saw it a couple of moths ago)

Any type of authentication is legal. You cannot hide data, but you
can authenticate by either a low-tech checksum, or a crypto-secure
hash code.

You are confusing two different things - encryption (keeping something private, private) and authentication (knowing the msg came from a certain source). FCC regs prohibit encryption of transmissions. However; using a PGP public, private key pair for AUTHENTICATION should not be a problem. Of course, you will need to set up method of getting a trusted copy of the public key and such. This is no different than authentication on the internet. BUT DO NOT ENCRYPT - that would be bad, very bad, and I don't think it would be the FCC that would come after you - it would probably be the NSA.

Considering the kinds of things we are supposed to be talking about on the amatuer bands, I'm not quite sure *why* you would need to authenticate a msg, but I don't see any reason why you couldn't use the PGP key system (or any key system for that matter) on packet.

From: pmbail01@spamtrampling-moocow.slug.louisville.edu
Message-ID: <C8D1E3158DDCCCAA.87B68769070C3829.3C5B8A4A0C8AB9C8@library-proxy.airnews.net>
Source record: 24311

This is probably a bit odd, but seeing as I've not seen info on it after much searching elsewhere, I figured I'd write and see if anyone might be able to help on this.

Anyways...was wondering if anyone knew where libraries (C or C++ is good, other languages would be good too) might be found for the following:

HAMCOMM interfaces (preferably)
Soundblaster interfaces (i.e. for RTTY or SSTV Soundblaster modem progs)

If possible, some info on AFSK and programming AFSK decoders in software is also much appreciated.

The reason I ask the amateur radio community for this--I've had an aspiration for some time to code a WRSAME decoder. Not strictly amateur radio related, but there is a lot of existing ham radio software that has parallels to what I'm planning. It certainly won't be anything for broadcast quality, more a toy and maybe a tool for SKYWARN weather-nets. I'm still rather new at programming for radio related stuff, hence the request for help.

(Of course, if there are any hams who'd actually like to start a project to code a software WRSAME decoder, feel free to write. It would make the work a bit lighter, in any case...I'll be glad to send along the stats for WRSAME for anyone interested.)

Okay, I'm sort of lost about how this authentication works in the way you all seem to imply .... if a system wants to authenticate itself to another machine, then it would send the other machine its public key. FOr the other machine to finish the authentication, it seems it would have to send the same key back. How would this be secure? A surface evaluation would seem any old server could step in and grab the public key, since nothing was actually sent using the key (just the raw public key), and just use it for itself. It seems like some initial random messages would have to be encrypted and exchanged so that the keys would actually do something to prove their value. Bouncing a public key around just doesn't really sound like its doing anything.

I would think a authentication system would work like this:

1) Server A needs to talk to a process on B

2) Server A somehow comes to knowledge of Server B's public key (we want worry how).

3) If server A was to PROVE it was Server A, it seems it would have to send its public key, along with a random length/content string and that string's checksum, in a stream that was encrypted with server B's public key.

4) Server B would have to reply similarly, with a new random string and checksum sent by Server B encrypting the transmission via Server A's public key.

5) Then everybody would know each other IS indeed actually each other, and then unencrypted data could flow.

Does this sound way off or not? Would the random strings and checksum be considered an "encrypted communication"? Am I narrow minded in my thinking of how it should work?

Thanks for any light you may shed,

David - KF4MOK

I think the main practical use you be, say if you were posting
controversial messages in the Land Line Lid debate on packet. You sign
all you're messages. Then someone angry out there fakes a message
with your callsign and puts in all kind of offensive comments
or something. They sign the message like you do, but wait
they can't cuz' they don't have your key. Everyone gets on
you for the offensive message, but you point out that the
message is a forgery because they signature is invalid. They
have youre public key and can check this.

PGP authentication is specifically outlawed on packet in the UK. I think
that may also be the case in some other countries. The "justification"
for doing that is because you could theoretically hide some sort of
secret message in the PGP signature.

>Considering the kinds of things we are supposed to be talking about

I agree that on an amateur radio network it should not be necessary. If
you have 100 percent confidence that messages will never be altered in
transit, or that callsigns will never be pirated, then it definitely
isn't necessary. (When the issue was last "debated" on packet over here,
one of the loudest objectors to the use of PGP sigs was one of the very
few people I have ever seen claim that a message had been altered in
transit...)

I have received good responses to my post. Thanks to all that had sent email.

For all those wondering, it is possible to do packet on a Zaurus. You must use a TNC, Baycom's are not an option as they need propeitary software to run. The serial port on a Zaurus is not RS232 compliant, but a simple PC-Link cable will fix that. From what I've been told, this cable connected to a TNC will allow packet using the terminal emulator in the Zaurus. In fact, I've received a post from a fellow Ham who has been using this kind of configuration for some time now.

Again, thanks for all the help.

Actually, there are a number of software packages capable of utilizing
BayCom modems.

TNC's carry "proprietary" software as well, contained in the EPROM. The TNC
also provides a small "computer" (Usually a Z-80) to run that software.
Since it's on an EPROM, it can be upgraded but not easily.

The BayCom lets your own computer do the work, and since it uses software
instead of firmware, updates are about as easy as it can get. - Just run
newer software.

If your palmtop doesn't have enough horsepower to handle the software, why
not just say so?

I was thinking about something along the lines of a packet based Skywarn system and perhaps a network of weather sites. False information in Skywarn could have devestating effects to the involvement of amateur radio service with skywarn. I've been playing around with the idea for just a few days, and it seems the authentication aspect is really the only thing to worry about. I am told "hackers" like to bully these nets often, such as wiping out voice coms, etc. I'm sure there are eloquent ways to change that over voice, but packet may be more effecient and repeatable than voice coms as a whole, if proper clients were written and the network was designed to switch packets (so a client could talk directly to the net controller's machine or server that the net controller is connected to (net controller is = NWS liason). Most "hackers" only want to be annoying at minimum expense. I doubt they would be as apt to attempt to invade a packet network. Half of them probably wouldn't know what it meant....but just in case, authentication would be the nail in their coffin.

I have discussed it with fellow operators, and the ones I have talked with, have liked it, though it has not been up to higher level than these people within my organization. It could also serve to be an incentive for operators to upgrade their stations to high speed capability (its funny people will pay enormous price tags for an HF station, but will not spend more than $50 bucks for a used TNC to put up a packet station).

You should be able to use a TNC with your Zaurus. However, Baycom modems require the computer to perform the TNC functions since it is a simple modems. A terminal emulation program won't cut it. I don't know of any Baycom software for the Sharp. Another drawback of the baycom is it draws its power from the serial port of the computer and palmtops have trouble supporting it. You can modify it to run on its own battery. Any full fledged TNC should work OK with a terminal emulator.

You will probably need to contact Kantronics as the
current firmware requires a small extension board when used with the
KAM unit. This is required for version 6.1 and greater.

This authentication thread is beyond the scope of Ham radio. If you peruse the sci.crypt archives you will see the subject rehashed at least once or twice a year.

The original application was, that a person would connect to a BBS or IP station, be prompted for a password with a hex number which is their stored password hashed or encrypted with the date.

They take this number, put it, along with their password clear text, into a program, and the program outputs a number that should be used as the return password.

Something like that...

Yes, I agree that PGP could aid enforcement. I would guess that it was
outlawed over here because there was almost hysterical opposition to its
use from a few people within the hobby, and that they were probably
hounding the regulatory agency. In that situation, when you're being
hounded by users of a chunk of spectrum that earns you very little
money, you take the easy way out!

I can see where that would come in handy - of course you would have to hack some code to automagically authenticate the packets as they came in. From a hackers point of view though, it is not so much that I could 'forge' a skywarn report, but just broadcast crap on your freq. so you couldn't get your authenticated packet thru. Or set up my TNC to continuously attempt to connect to your skywarn node (using your call sign, of course).

Another interesting method of authentication would be to have every TNC have a unique 'address' burned into a ROM at manufacture (much like every ethernet card has a unique MAC address). Only this address would be placed in every packet - now we would KNOW what TNC sent the msg or we could just add a new command to the TNC to query the ID on the sender's TNC. A repository of who owned what address could be set up and you could check it out on a web page or the 'QRZ TNC address database CD.'
Of course, methods of transferring the address to different people would be needed but that is no more of a hassle than exchanging/remaking public keys in the first place. Sounds like a project for TAPR.

Of course, the above solution only verifies what TNC the packet came from. Maybe we should put iris or retina scanners on each TNC so that it can only send packets when the 'real' operator is on station. Again a new command could be added to the TNC (something like -
CMD> QUERY_OPERATOR_ID -IF_FAILURE_THEN- MELT_HIS_EYEBALLS_OUT). Now that's security.

There is another method of authentication you might want to look at - especially for use in a skywarn situation. Since it is more important to know that the msg orginated from a valid skywarn member than it is to know exactly what member sent it, you could use a time based authentication algorithm. I goes something like this. Based on the current time, you use an algorithm to create a checksum, everybody in your skywarn group knows this algorithm and someone could even write a little program to continuously generate the checksum on their laptops or pocket calculators. This checksum is read off at the beginning and/or end of a transmission. You can make the checksum as accurate as you want but you will need to keep everybody's clocks synced at that accuracy (one minute is not a bad interval) but you could go to seconds if your users have GPS's to continuously sync with. You can create different algorithm sets (maybe a dozen) and when the skywarn net goes up, the net op simply says 'This is skywarn net coming online, authentication system DELTA now in use' Now everybody knows to use the DELTA algorithm. The nice thing about this system is that it can be used on either packet or voice (ever try reading a PGP key over voice?). Make sure the checksum is about 5 to 10 numbers or better yet letters.
So a typical conversation with the net might look like this.

Skywarn Net, this is KC8FAY, authenticating Alpha Echo Charlie Delta Delta
I have 27 funnel clouds directly overhead and touching ground, stand by
while I change my underwear. KC8FAY.

KC8FAY, Skywarn Net, authentication verified, confirming your 27 funnel
clouds and underwear change.

It is up to you weather (ha, ha) or not you want to have the net op
authenticate or not. If you do you will need to change your time interval
down, since this whole conversation probably did not even last 15 seconds.

Now, if the time based algorithm is causing problems because of syncing,
you can always use the same algorithms with preprogramed seeds. Each user
is given a list of seeds and these seeds are used to generate the checksum
in order. Of course, if you go this route, you might as well just print a
list of checksums for each user and let them go.

There are lots of different ways to do this - you could even do the old
passphrase system. Each member and the net op is given a list of phrase pairs
and the conversation would look like this.

Skywarn Net, this is KC8FAY, authenticating you have a big nose
I have 27 funnel clouds directly overhead and touching ground, stand by
while I change my underwear. KC8FAY.

KC8FAY, Skywarn Net, authenticating your butt is bigger, confirming your 27
funnel clouds and underwear change.

You will have to play with how/what to implement to maintain authentication
and timely exchange of information.

Matt Gilbert
KC8FAY

2060. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6ib7fp$9do@news.Hawaii.Edu>
Source record: 24235
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman (KH2PZ / KH6)
(rec.radio.amateur working-group)

2061. 2 meter FAX

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-01 00:00:00 UTC
From: Steve Porter <sporter@mail.snider.net>
Message-ID: <354A86D5.21BF@mail.snider.net>
Source record: 24236

I hope that this is the proper venue for this discussion. If not, I apologize in advance.

I know that FAX transmissions abound on the HF bands and I know about APT and GOES satellite imaging, but what about on 2 meter FM?

A friend and I have been toying with the idea of 2 way VHF FM FAX communications for sending images back and forth.

I have perused the part 97 rules and don't find anything that specifically prohibits this mode of operation.

Generally, if something is permissible on HF, it's permissible for even wider bandwidths on VHF (read that higher transmission rates).

I would appreciate hearing from anyone who has any experience in this realm of operation.

73,
Steve Porter, N5JPL
Bauxite, Arkansas, USA

2062. PCMCIA TNC was Packet with a Palmtop

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-01 00:00:00 UTC

Hang in there, one is in the works.
For the guys that have responded to my "feasability study" this is
also an update.
I have some of the parts, a '386 computer for development(I don't
want to use my laptop and possibly ruin those slots), a prototyping
platform and have just found an interface from PCMCIA to an ISA bus
(something that I can replace easier than replacing the year-old
laptop). I'll probably order the interface within the week.
I'm also looking for some samples for the card enclosures. I have
a friend that might be able to get some for me. If not, then I'll have
to buy some from a distributor. One way or the other, I'll get some.
I'll first go for 1k2 to get a feel and then maybe for one that
will do 1k2 and 9k6 or s/w switchable. Maybe I'll get one of these
palm tops later and develop software for them after I get one of these
cards to work. Kind of up in the air.
It's costing me a few bucks to get going, but the more I hear you
guys say that there is a demand for such an animal, the more encouraged
I become to continue this endeavor. If I get some more e-mail from
some people that say they want these things, maybe I'll send out
updates on my progress more often.

Message-ID: <6if619$e6j$1@news.goodnet.com>
Source record: 24238

You are correct Steve, in that all specified and unspecified data protocols are legal on VHF. The rule of thumb I go by is to read the rules (they are online), interpret the rules my way, and then begin operations. If my interpretation is incorrect, then the FCC or ARRL monitors will tell me. If they don't tell me, I don't worry about it.

The basic rule is, you are to have fun. Amateur Radio is a gift from Congress, in which people can have fun in a spectrum set aside for that purpose, and subsidized by the taxpayers (by not selling the spectrum for continuous revenue).

Technically you will probably find that 2m SSB is better, but you can use FM. I did this years ago with an AEA PK-232. Your radio will get very hot, so make sure you have a nice heat-sink. A good old 100 Watt Master II running at 60 Watts should work fine...

Steve

2065. Re: DSP-2232zx and lagacy of AEA DSP-2232 ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-02 00:00:00 UTC
From: Rob Kling <rkling@umich.edu>
Message-ID: <354B3C83.6B5A@umich.edu>
Source record: 24239

The 2232 is the high end DSP unit in their line of DSP modems. It has had none of the problems that their other DSP units have had. I own one and think it is very good. I have some complints about the way they assign modems to ports. Case in point, to listen to all the modes on sats I have to disconnect my HF unit from the DSP unit and connect it to my VHF unit. All AEA would have to do was to move one modem to another port. Also, I had a problem with the power supply. You need a very clean signal to the DSP unit, I use a battery. I know now why all the external computer modems have low-level AC units as opposed to DC units; it is becuase they need to ensure that a clean DC signal is supplied to the DSP chip. Deja-News has a good history of the DSP 2232 unit. Given the history of AEA and DSP I would wait until some objective reviews have been completed, but if AEA hired good and qualified people then this new DSP2232zx, I suspect, will be a good unit.

Rob Kling

I once saw an article in 73 Mag on how to modify a Hayes type 1200 baud modem to run packet, I can't find it here now, someone did ask if I could.
Having said that, it would preclude using it as a standard modem, besides if you could unearth an old 1200 baud modem, they usually have a AM9710/9711 chip that can be used as a Baycom modem.

2067. TAPR 1998 Dayton Digital Forum and Friday Dinner Information

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-02 00:00:00 UTC
From: "Greg Jones", WD5IVD <wd5ivd@tapr.org>
Message-ID: <6ifflp$jk7$1@hornet.fibr.net>
Source record: 24241

```
Dayton 1998 TAPR Digital Forum and PACK*BASH
--------------------------------------------

Dayton Hamvention will be here later this month. Just as a reminder, the
TAPR Digital Forum is on Friday and this year starts much earlier than in
years past. In addition, the PacketBASH banquet will be held on Friday night.

If you haven't been to Dayton before, you should think about coming this
year. The dates for this year are May 15th - 17th. Check out the web page
http://www.tapr.org/tapr/html/dayton.html for any last minute changes in
the schedule.

The schedule for the TAPR digital forum on Friday is:

10:00 - 10:05am (5 min)
Introduction to Forum
John Ackermann, N8UR

10:05 - 10:25am (20 min)
TAPR Kit/Project/Organizational Update - Greg Jones , WD5IVD
TAPR Update and discussion on current activities.

10:25 - 10:45am (20 min)
Regulatory Issues - Dewayne Hendricks, WA8DZP
Update on Regulatory Issues related to Digital activity.

10:45 - 11:30am (45 min)
TAPR 900Mhz FHSS Radio Project
Tom McDermott, N5EG / Greg Jones, WD5IVD
Latest Information on Status and design of 900Mhz FHSS Radio Design.

11:30 - 12:15pm (45 min)
GPS Projects - Steve Bible, N7HPR / Tom Clark, W3IWI
TAPR has introduced several GPS related items in the last year.
DGPS, GPS Interface boards, TAC-2, Future TOC add-on, etc

12:15 - 12:30pm (15 min)
Break

12:30 - 1:00pm (30 min)
Linux AX.25 - John Ackermann, N8UR
Making AX.25 play on Linux

1:00pm - 1:45pm (60 min)
APRS SIG and APRS Update
Stan Horzepa, WA1LOU, APRS SIG Chair with the APRS Authors
SIG meeting discussing current and future activities in APRS.
```

PACK*BASH and TAPR Banquet

Attending the 1998 Dayton Hamvention? Then don't miss out on the PACK*BASH and TAPR Banquet.

What?
An event for the digitally-inclined ham, featuring:
* Buffet dinner
* Speaker Doug McKinney, KC3RL
discussing GPS and his Bouy projects in the Pacific
* TAPR special interest group meetings
* Prize Drawing!

When?
Friday evening, May 15, 1998
Doors open at 7:00 pm; dinner served at 7:30 pm
Speaker and meetings after dinner

Where?
NCR "Sugarcamp" Conference Center, 101 W. Schantz Ave. --
South of downtown Dayton, just west of Main St. (Rt 48).
Maps available on the TAPR web site or at the TAPR booth.
(http://www.tapr.org/tapr/html/dayton.html)

How?
Dinner requires advance registration and payment through TAPR.
Tickets will be available at the TAPR booth on Friday, though
we strongly encourage registration <before> Hamvention. The cost
is $20.00 per person, tax and tip included.

All amateurs are welcome to attend, enjoy the speaker, and
participate in the meetings, although only those purchasing a
dinner can eat.

To register, contact:
PACK*BASH
c/o TAPR
8987-309 E. Tanque Verde Road #337
Tucson, AZ 85749-9399

Phone: (940) 383-0000
Fax: (940) 566-2544
Internet: tapr@tapr.org

Visa/Mastercard Accepted

Who?
PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet
Radio, the national leader in digital communication -- and the
Miami Valley FM Association, Dayton's packet radio club.

For more information (including maps), go to
http://www.tapr.org/tapr/html/dayton.html, or send e-mail to

tapr@tapr.org. You can request information via packet radio at
BASH@N8ACV.#DAY.OH.USA.NOAM.

2068. Re: KPC-3 25-pin to 9-pin cable?

Source record: 24242

CrACKeD <cracked@primenet.com> spewed forth:
I found the appropriate cable last night (just a standard 25-pin to 9-pin
"AT modem cable"), but I have yet to get this laptop talking to the TNC. I
have only one COM port enabled (COM1). The most I can get with my packet
software (Pax) is one high ASCII character as soon as I power on the TNC.

Try checking the baud rate on the terminal program you're using.

Matthew

State of the art and state of common practice in amateur packet are
two very distinct things. Common practice is still Bell 202 AFSK over
FM 1200 baud. Ugh. The currrent speed demon in deployed systems
is the 1.2 Mb data radio used in the Slovenian national network. It is
plain FSK, however, so while it is fast, it isn't sophisticated in terms
of its modulation.

Sophistication still belongs to the MSK designs. The WA4DSY
(aka GRAPES) 56 kb RF modem is still, after 12 years in the field,
a benchmark system. It is available off the shelf from PacComm.
But GMSK in Britain has just unveiled another 56 kb system which
may rival it in sophistication.

Various ethernet over microwave systems are still kicking around
on various people's workbenches. And TAPR has a major effort
underway to field a 256 kb SS radio in the 900 MHz band. But neither
of them are "real" at this point in terms of being deployable systems.

The major problem with any of these systems is critical mass.
Unless there are several others using the same system in your
area, owning one of the faster systems does you no good. That
drops you back to the default Bell 202 AFSK over FM 1200 baud
modems built into every commercial TNC. And that has served
to stagnate the state of common practice in amateur packet.

I haven't had a KPC3 for some time now, but if I remember correctly,
don't you have to hit the asterisk * key several times until the
baud rate is automatically adjusted, and then you get data.

Another possibility, sometime el-cheapo modem cables don't have all
the necessary wires in the cable. I think this is how the connectors
should be wired if you can ohm them out.

Assuming that you have configured AGWPE to use a Baycom modem and that
you have selected AGW as the host mode in WinPack, the common problem
seems to be that people aren't setting "SerialPort BaudRate" to 1200 in
the AGWPE set up screen. (Accessed by right clicking the AGW icon.)

While I'm commenting about WinPack and AGWPE, a couple of other points:-

If you find that "MH" in WinPack shows times that differ from the time
stamps on the monitored frames, try putting a TZ setting into your
AUTOEXEC.BAT. Example - in the UK "SET TZ=GMT00BST". Any valid TZ
setting will fix the problem.

Users who have previously been using WinPack with a TNC in terminal mode
may miss the fact that, im host mode, you can split the main screen to
give a monitor window at the top and a traffic window at the bottom.
"Options", "Split Window", or press Ctrl+S.

In other words, if hams are not interested, they simply will not do it. - And the great majority of packet operators are not interested in high-speed packet access.

There are a few networkers who have shown an interest in high-speed links in my area, but that's all. I maintained a 9600bd user port on my BBS for several years, and though it was well "advertised" on the BBS, the repeater, and in club meetings, at no point did any of the system's users show any interest in setting up to utilize that port. I live out in the country; The main HUB BBS for the Dallas/Ft.Worth metroplex had better luck than I did, but only slightly. Eventually that station's 9.6kb user port was shut down due to lack of utilization as well.

These events bear out a theory which I have heard different versions of, over the years: Not only does it make more sense to use the high-speed equipment on backbone links rather than user ports, but it's much more likely to happen there, as well. The "critical mass" is much easier to attain, with a much smaller number of participants.
For example: A local networker and myself have agreed to set up a high-speed link between my node/BBS and the city of Sherman, TX, 15 miles away. ("Critical mass" of two.) The project does not require the participation of local packet users, since it is modest enough for our means. Since there is an existing 1.2kb net in place, local packet ops will, for the most part, not even be aware that the new HS link has been put in place. - They'll just notice one day that it's a lot quicker and easier to connect to the ROSE/IP net to the west of Sherman. (My direction) After a week or two it will be taken for granted and will no longer be considered remarkable. - But it will be used daily by just about all of the packet ops in this area, right from the start.

Hint: If your backbone link is X number of times faster than user access, that link will handle X number of users transparently. When user access speed goes up, capacity of your backbone links effectively drops, and transparency (network performance) goes down the toilet.

A more radical situation, involving a "critical mass" of one is also developing here. I have recently set up to run FlexNet, and in reading about the European FlexNet network, I became interested in the high-speed, full-duplex links they use there.
Nobody, not even the local networkers have shown any interest in such a fulldup link, despite the fact that there's plenty of room for it, once you go above two meters. A 220 Mhz link would do just fine, using inexpensive equipment.
Since I'm the only one in my area who is currently interested in either FlexNet or a fulldup backbone link to a second FlexNet node, It's my lookout to go forward with this, if it's to be done at all. It's within my means, so why not?

The point is that high-speed User access requires a significant "critical mass", but network links do not. My 9.6kb User port went unused, but that problem simply does not apply to backbone linkages. They DO get used, by everybody.

One more thing you shuold be aware of: SB "compatible" cards can cause
many problems - the original SB definitely is preferrable. E. g., I
learned that my "compatible" card (an old Shuttle 48 - 16 bit) would
work with 1k2 but not with 9k6.

> Usualy i run with a baycom 1200 bps,with TSThost143 Dos mode on a

If you have other equipment for packet and you know that it works with
your computer, try to install flexnet with these modems / TNCs first.
When you got that to work, replace the hardware you used by the flexnet
soundcard modules.

NOS-meisters: is it possible to run a commercial email client like Eudora Pro or Netscape, etc., without additional hardware on the same machine as a JNOS server so as to send point-to-point SMTP messages over radio? That is, can Eudora, for example, talk to a JNOS server on the same machine without first going out of the machine and back by say Ethernet connections?

We'd like to use Eudora as our mail client (mailer) with JNOS as the server in some point-to-point experiments over VHF and HF. We'd like to do this along the lines of how it's done with say BM (as we understand it) running on the same (Win95) machine as JNOS.

Source record: 24261

Yes. A good TNC for the Commodore64 is the MFJ1271 but you will need
the "Digicom" software to drive it. MFJ dont supply the software, but
it is freeware and on many CBM sites on the web. Try
videocam.net.au /cbm/info-txt/tifcu/ or www.eskimo.com/
Or just search "digicom". The woftware works on both C64 if you
download the 64 version or on the C128 if you download the 128 versions.
V5 is latest version written and works great but needs a 1581 drive.
The earlier versions v3.61 v2 work fine with most any drive.
Another tnc available that uses same software if the one sold by
A&A engineering in Calif. It uses the 7910 world modem chip.
Aloha
Joe

Source record: 24262

Packet BBS message handlers DON'T recognize the message number scheme
generated by mail clients like Eudora, Netscape or whatever. For example, I
cannot generate a message in Eudora Pro and send it via my TNOS gateway to
a packet BBS. The BBS will reject the message because it doesn't conform
the the standard message ID format. Maybe others can be more precise. This
is the general idea, though.

Source record: 24265

Does anyone know if there is a way to set up some sort of a personal mail system (PMS) for use with Winpack? I am now using the AGW packet engine with my baypac modem and so have lost the use of the mailbox that I had using a KAM tnc.

thanks, Mike AB7RU

2092. KPC-9612 won't work at 9.6k

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-05 00:00:00 UTC
From: Francesco Bosio <Francesco.Bosio@asit.uni-bocconi.it>
Message-ID: <354ED591.4ACA@asit.uni-bocconi.it>
Source record: 24266

Hi,

Here at the local Ham Club we are testing our Kantronics KPC-9612. While
al 1.2kbaud
the tnc works ok at high speed it seems to have some problems. Infact
the tnc on port
2 (9.6 k) won't get more than 150/200 cps when transferring files in
yapp mode. We
have tested the equipement both on a modified Kenwood TM-732 and a Tekk
KS-1000 radio
data. At the same work conditions my TNC2 clone download a binary file
at 450/500 cps
speed!. We would have any comment by KPC-9612 users to share experience
about this
problem. The tnc seems to receive well almost all packets but something
in transmission
does'nt work. We have tested the tnc in various conditions but the
problem still remains
the same. The output sound as all the tnc settings seems to be regular.
Someone said me
that the kpc does'nt carry a true G3RUH modem... Any comment or
suggestion from KPC-9612
users would be really apreciated.

Thanks / iw1bxl -
Francesco

2094. Re: What is the state of the art in packet for users nowdays?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-05 00:00:00 UTC
From: Bas de Jong <bdj@dutch.nl>
Message-ID: <6inki4uuu1@news.NL.net>
Source record: 24268

Here, in Holland, a lot of users are still qrv with 1200 baud AFSK, but also 4k8 HAPN and 9k6 G3RUH standard is commonly used. Apart from this, sporadic experiments are set up using higher baudrates.

For interesting readers, pse take a look at www.dutch.nl/bdj/index.htm , where I describe a 38k4 baud packet setup, semi duplex on 23cm using manchester modulation. We have tested it on 76k8 with succes, and even higher is no problem apart from the fact that external clocking is needed. Also, it seems that the pc, even a pentium, running JNOS has trouble to keep up with speeds higher than 76k8 due to the high interrupt latency. But more experiments arte needed to confirm this. Rewriting the SCC-driver, currently in C, might be essential.

From: James Jefferson <jjeffers@deskmedia.com>
Message-ID: <354FC878.64F0@deskmedia.com>
Source record: 24272

Hello Everyone, it seems that I'm making my first pilgramage to Dayton this year. Since I run an ampr.org gateway here in Minnesota, I'm interested in operating 9600 baud TCP/IP in dayton for a few days. What it the typical configuration there? Am I going to overrun by large quanities of RF? The equipment looks like my laptop running linux, a Baycom PICPAR 9600 modem, and a Kenwood TM-V7A.

If someone would be so kind as to forward a IP request (and some frequencies and network info as well!) to the Ohio IP coordinator I would be much in debt. Otherwise a name and an e-mail addy would do =)

Thanks and 73's de

How can it do so if the baud rate the TNC is set to doesn't conform to
the baud rate of the terminal program. Try hitting an asterisk or two.
I've used Qmodem with the KPC-3 although to be honest, it's been
years since. You have to try to get the thing to work. One more
comment, the KPC-3 comes up in newuser mode, a mode which only
offers limited functions.

Message-ID: <199805071232.OAA16122@iag.tno.nl>
Source record: 24183

Hello dear NET/Mac-user,

Yesterday I put a new version of NET/Mac on my homepage...

Since I will take a new job in about 4 weeks I have removed
all mailinglists from the machines I used to use and installed
those on my private e-mail facility...

My office-e-mail-account will change by June 1st from:

a.vangaalen@nitg.tno.nl

to:

vanGaalen@wt.tno.nl

If possible I would like to receive all hamradio-mail at my
house, so I suggest you use: vanGaalen@caiw.nl

Anyway... Because I am in the middle of a process to automate
the distribution of NET/Mac, IM/Mac and][2Mac, I had no time
yet to really send out the new NET/Mac 2.3.66... I have plans
to do so, probably during the upcoming weekend...

Now what happens today? Check the included document and learn
about the new NET/Mac, and where it can be found...

These internet-search-engines have managed to find the new
version even before sending it out to all of you...

2109. WB5THT Daytona Beach gateway going QRT!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-07 00:00:00 UTC
From: John Canfield <jwc@nospam_america.com>
Message-ID: <6iscoq$t7c@bgtnsc01.worldnet.att.net>
Source record: 24184

With a somewhat heavy heart, I must shut down the wb5tht gateway located in Daytona Beach, FL. (gw.wb5tht.ampr.org, 44.98.40.1 / 206.125.236.18)

My ISP is going out of business, and so it seems me. I don't think I want the hassle of trying to negotiate with another ISP -- it took me about four months to strike a deal with this one. My guess is that Daytona Beach will be permanently without an Internet gateway from Friday afternoon on.

I will be pulling the plug this Friday, May 8 sometime in the afternoon (maybe around 1700 hours UTC).

Packet traffic that was going to wb5tht.#dabfl.fl.usa.noam should be directed to n4gmu.#nfl.fl.usa.noam.

It was a real learning experience over the past three years or so we were in operation.

73 to all - John, wb5tht@worldnet.att.net

2112. Digital voice transmissions on amateur radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-07 00:00:00 UTC
From: Nick Lansley <usenet@lansley.demon.co.uk.nospam>
Message-ID: <894563974.3855.0.nnrp-01.c2de030e@news.demon.co.uk>

Synopsis: This informal article considers the possibility of using digital techniques for voice transmission on amateur radio wavebands to overcome the disadvantages of using analogue voice over long-path narrow-bandwidth communications.

Author: Nick Lansley G1KZI

Background: Nick's interest in digital techniques for narrow-bandwidth voice transmission has been kindled by the many disadvantages he has experienced associated with analogue voice transmission, combined with many advances in digital data compression researched and deployed by companies involved with Internet telecommunications. Nick lives in Norfolk, England and is QRV on 6m, 2m and 70cm with callsign G1KZI, and his work is closely involved with the Internet as he is responsible for the technical development of home shopping for the UK national supermarket chain Tesco.
--

Introduction

I've been reading recently about how some SW radio stations and SW radio manufacturers, in order to address the slow but sure decline in SW audiences, are working to introduce digitally-encoded signals alongside (and later instead of) analogue signals in order to improve sound quality and reduce many of the effects of fading, and provide this digital service within the 5KHz audio bandwidth used by such stations.

As an HF listener interested in the plethora of digital signals (RTTY etc), and knowing well that most digitally-encoded signals can be 100% deciphered when the audio components have faded to below levels discernible by the human ear (well my human ear anyway!), I'm certainly looking forward to this development, but I
wonder if HF radio amateurs have considered looking into the use of digital voice transmission techniques.

I will confess a limit in my knowledge of both digitising techniques and the modulation of digital signals, so I ask that you accept (and correct) any gaps or assumptions that result here. I truly wish to see if any amateurs are interested in digital voice transmission. I wish as much to stimulate discussion on this topic.

Digitising techniques

I understand that digitally-encoded voice requires, in theory, much more bandwidth than analogue voice because the sampling rate has to be (at least) twice the highest frequency of the original voice signal in order to encode

both the peak and trough of the audio wave. If you take a standard sinusoidal audio tone, two or more samples are needed for each complete 360-degree wave (I say "or more" because in reality, two samples would actually recreate a square wave when converted back to analogue). In amateur radio terms, supposing the maximum voice frequency to be transmitted is up to 3KHz. This would require a sample rate of 6KHz. However, if each sample is 8-bit (allowing 256 levels of sound volume from silence to 'maximum') then we have 256 bits x 6000 samples = 1536000 digital bits to modulate onto a radio wave per second! Even if we reduce the sampling depth from 8-bit to 4-bit (just 16 levels of sound volume) then 16 x 6000 = 96000 digital bits.

Compression codecs and resulting bandwidth

Thanks to those mathematicians who try to outsmart each other's sampling rate/compression algorithms (such as Lernout & Hauspie's CELP and SBC methods, GSM (used by digital phones), MPEG (layer-3), and Microsoft's ADPCM), we can get some serious performance enhancements and actually improve on discerned speech quality for the same bandwidth than the original analogue signal.

Take a sound digitised using the Lernout & Hauspie CELP algorithm, sampling 4.8kbit/s 8,000 Hz, 16 Bit, Mono (available on most Win95/NT computers if you have installed Microsoft NetMeeting or other Internet Phone package). This algorithm compresses the sample to an actual data transfer rate of 5KBit/second (source: Start Microsoft NetMeeting, select Tools - Advanced - Audio - Advanced and read bitrates for each sampling codec). If you could drive the transmitter directly much like CW where ON is digital 1 and OFF is digital 0 then I understand that the bandwidth would match the bitrate (5KHz bandwidth for 5Kbit bitrate/second). Using the two-tone technique used by RTTY and packet, extra bandwidth overhead would be required to properly accommodate the two tones.

5KHz bandwidth is a bit excessive, but a reduction in the audio sampling rate so that the maximum recordable frequency is 4KHz not 8KHz, and bit-depth set to 8-bit (256 volume levels) not 16-bit (65535 volume levels) then surely the bandwidth could be halved, fitting the modulated digital signal usefully within an accepted bandwidth of 2 - 3 KHz.

Perceived advantages of digital voice

I perceive that there are several specific advantages to digital voice transmissions over analogue:
1) Digital signals often can be detected and decoded at a level below that discernible by the human ear (well, my human ear anyway). This means communication may well be achievable and reliable over even the most difficult paths where analogue speech fails.
2) Digital voice signals would not suffer from background noise - it's either there or it's not!
3) A two-tone based transmission would mean that many signals could be on top of each other (e.g. pile-up conditions) but only the signal with the two

tones received at the right two frequencies would be decoded. For "CW" (for want of a better phrase)-style transmissions, the signal received at the 'correct' frequency tone would be discerned.

Challenges for amateur radio
---
1) The same encoding and decoding techniques would need to be deployed at each station involved in a QSO. This would require the adoption of one or more digital codec standards.
2) An allowed bandwidth for digital voice would need to be agreed voluntarily and not exceeded, just as it is today for SSB analogue voice.
3) Compression techniques may cause dynamically variable bandwidth as some sounds are bound to compress better than others.
4) Some digital methods use a "don't care if part of the signal is missing" and decode as best they can with digital distortive results. Others use correction methods (built into transmission, or receiver requests re-send) which can cause a rapid drop in digital throughput). Which is best?
5) Where in the bandplan would digital voice be voluntarily permitted?

Conclusions

I believe that digital voice would be an interesting and challenging new mode for radio amateurs to adopt. It would require a coherent international effort for useful standards to be created, although as in other aspects of amateur radio, a society of like-minded digital voice enthusiasts could be formed to create initial interest. After all, there's nothing like a "new sound" on the amateur radio bands to raise inquisitive heads!

Nick G1KZI

2113. BayPac, BayCom, and Alinco DJ-G1 Handheld

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-07 00:00:00 UTC
From: Mark Trippe <marktrippe@worldnet.att.net>
Message-ID: <6it19h$ftb@bgtnsc03.worldnet.att.net>
Source record: 24188

Does anyonehave any experience with BayPac and Baycom? I have the handheld mentioned in the subject and am attempting to get started on packet - so I really don't know what I'm doing.

I'm not sure if I have the wiring correct, but I have yellow connected to mic tip, green to audio tip, and black to housing, red unconnected. I'm using mono (not stereo) plugs. Also, I've installed the shunt onto the BayPac for grounding the mic line thru the BayPac's internal keying resistor.

I ran BPMODE.EXE and the two tone tests seemed ok. I ran it again on an older '286 laptop, and the transmit wouldn't turn off when I stopped the test. So, I tried BPMODE again on my original laptop and the transmit had same problem. Have I screwed something up? Do I need stereo plugs?

I believe I did receive some traffic, but could not connect to a local BBS. Havbing never done packet before, I 'm sure there is something I'm not doing.

Anyone with suggestions, please e-mail to marktrippe@worldnet.att.net

-Mark

2114. Re: KPC-9612 won't work at 9.6k

Newsgroup: rec.radio.amateur.digital.misc

From: Joe <mitstoll@flinet.com>
Message-ID: <3552166B.79AD2F6D@flinet.com>
Source record: 24189

Hello Francesco,
I too have had problems with my KPC-9612. It
will receive with no problems, but the transmission problems persist. For
example, when I log onto my local bbs, I am told I have 234 messages to
list. I list them, and in the middle of the downloading of the messages
list, I get the following: FRMR sent FRMR received followed by some
number codes, for which I have had no luck finding any answers about. So I
went to an AEA PK-96, and have had no problems with it doing anything. Yes,
I also have heard that the Kantronics is not a true G3RUH modem. The AEA is,
it also is compliant with another standard, but I forget the callsign for
which it applies. Hope you are able to find out some answers to your
download problems with the YAPP protocol, but I suspect that they go hand in
hand with the problems I have had simply downloading a list of messages from
the local BBS.

73!

Cheers!!

Joe

One of last years issues of QST had an article on connecting a BayCom modem to a HP200LX. Had a picture of it on the cover. Had a chance to check one of those computers out sometime back. Nice machine, but I hated the keyboard. Trying to fit a numeric keypad on something that small is a bit too much. That's a big reason I bought a Zaurus. Nice keyboard and a software load-out that's more useful to me.

That is suprising since the principal of PSS Internet Services, owner of
those domains, was seemingly anti-spam. He got very upset at people using
up his resources to send junk and spam. He did support the gateway and
provided gratis hosting -- for that I am very thankful. I also hope the
spam stops from his domains.

All of those domains (and accounts) are being handed over to another outfit.
I don't know if they are local to Daytona Beach or not -- the name of the
new owner is AGI or ATI or something like that.

Nick

Digital Voice was pioneered in the early eighties I think. I remember an interesting article in HRT around that time. I no longer have a copy of the Article. From Memory the experiments we done on 70cms using HI-FI digital audio out of portable VHS video recorders. Don't think it was narrow band though - hence the use of 70cms

Can anybody else recollect this ?

Incidentally I'd go for a sampling rate greater than 6 kHz. Nyquist's theorem states that the MINIMUM sampling rate is two times the highest frequency to be sampled. At 6 kHz you'd get aliasing errors and you'd need a real brick wall filter to stop it.

Codecs seem a great idea what with the bountiful supplies of surplus Digital portable phones which will be hitting the Amateur Rallies in years (even months) to come. Also a log of Rigs these days are "packet ready" with 9600 bps capable digital inputs on the back/front panels.

Good luck with your experiments. I guess you could do it anywhere in the all mode section of a particular band though I think you'd need to sent a CW ident. periodically and make sure you work out the correct mode of transmission for your logbook !!!! (F1A ?)

Why don't you try getting two PC's up and running PPP across a modem link, then try netmeeting over it between them. Once this is working switch to a radio link. Should work if you can knock up some kind of phone patch for your rig (MAPLIN do them). After all the Analogue bandwidth on a phone equates to the audio bandwidth on a transceiver. You'd have to use a two dual banders though as the circuit need to be full duplex.....thinks..... I've got two dual banders, two PC's two modems..... I think I might beat you two this !!!!

No - without some careful pulse shaping you'd have an infinite set of
sidebands at 5kHz intervals, which means your bandwidth would be far more
than the bit rate.

>(5KHz bandwidth for 5Kbit bitrate/second).

However, you can improve on this. The bandwidth limits the *baud* rate:
the maximum number of symbols you can send per second, but not the
bit rate, since there's no requirement to send only one bit per symbol.
The relationship between bit rate and bandwidth depends on the
signal-to-noise ratio as well, via Shannon's law. With some reasonable
assumptions about the noise distribution, the maximum achievable
bit-rate is equal to the bandwidth (in Hz) multiplied by the log
(to base 2) of 1 + S/N. For a large enough S/N ratio just multiply
by the S/N in dB and divide by 3.

But to get the maximum bit-rate you need to use the entire bandwidth.
Simple on-off or two-tone keying at 5kHz won't do this - you need
carefully-designed waveforms to encode more than one bit in each
symbol, and you then need to be able to distinguish the symbols
at the receiving end, which is why the S/N ratio is relevant.

There are more subtle forms of "noise", too - at HF, ionospheric
effects can distort the signal, and in practice you would be doing
well to get 2400bps over a 3 kHz channel. At VHF you could manage
more.

> Using the two-tone technique used by
> RTTY and packet, extra bandwidth overhead would be required to properly

> then surely the bandwidth could be halved,

which is exactly the method used in the present telephone system 8 kHz
sample rate times 7 or 8 bits, giving 56 or 64 kbps. *If* you can
compress that down to 2400 bps you would be in business.

Yes, but remember there's a tradeoff between S/N ratio and bit rate.

> 2) Digital voice signals would not suffer from background noise - it's
> either there or it's not!

Each bit is either right or wrong, and without error-correcting codes
you have no certainty about this, so there will still be noise, just
of a different kind.

Unfortunately not so if you're using the bandwidth to maximum advantage,
filling it with coded symbols. On the other hand, with a regularly-
clocked waveform there might be scope for synchronous detection
techniques.

Ever wonder why your digital cell-phone battery lasts longer than your old analog cell battery, even though they are basically the same battery? digital signals don't need a 100% duty cycle like analog does!! I sure wish my HT was digital....

2123. Packet Frequency Listing & Hamvension Info

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-08 00:00:00 UTC
From: Keith <AndrewsKM@aol.om>
Message-ID: <6ivhnu$kj4$1@newsfeed.ball.com>
Source record: 24198

I was wondering if anyone knows of a site one the internet that contains a listing of current packet sites and their operating frequencies broken down via band and location. I know the ARRL once included this information in their Repeater Directory, and I remember when they stopped TAPR was going to take up the slack on the web. I've searched the entire TAPR site and can't find any indication that this is being done. If anyone knows where I might find this information please let me know.
Secondly, does anyone know at what stage the TAPR Spread Spectrum project is currently. I recently read a great deal of info on it at the TAPR site, and several projected dates for testing were given up til Feb 98. It would be GREAT if a kit was avaialble for this years Hamvension here in Dayton Ohio. If anyone has andy info on this I would really appreciate hearing.

Thanks
Keith Andrews

>-Mark

Mark, almost always, when a baycom won't stop transmitting,
it's because RF has gottrn into the circuit. People test these
on HTs with ducky antennas, and get locked up a lot.
Try it with an external antenna, and I think the problem will
go away. If not, try some ferrite cores on the wires to the
baycom unit.

Don't think so. Bit rate is bits of data (incl. start/stop/parity) per
second, baud rate is the number of transitions (level, FSK, whatever) over
the transmission medium. Generally
bit rate == baud rate nowdays.

2126. Search a SSTV software for AEA PK-900

[rest deleted]

Thank God there's someone in the radio community which understands that.
I usually cringe while reading packet-related ham info referring to "bauds"
when they mean bps.

The Winter 1998 issue of Packet Status Register had an update and more
information can be found at http://www.tapr.org/tapr/html/taprfhss.html.
It'll be a while. You should be able to get more information at the TAPR
booth at the Hamvention.

take a paper clip and jump the xmit to the rec on the laptop DB-9
and any typing will echo.

Get a RS-232 test box from RS if you do a lot of computer serial I/O port

connections. (Saves lots of time)

also I use 4800 baud (computer to TNC) on all my 1200 baud xmit TNC's

>hence the use of 70cms

I'm in the U.S. (so I didn't see the article in question), but around
that time Sony and Panasonic were marketing devices that would record
digital audio on VHS tape. At least here in the States, they actually
converted the audio to a NTSC-standard video signal & then recorded it
on a video recorder. (the Panasonic machine included the VHS
transport - the Sony was designed to connect to an external VCR)

The TV station I was working for at the time used it to send the audio
of a classical-music program to a local radio station for simulcast,
and it worked great. But it required the same 4+MHz bandwidth
required for a TV signal, not very efficient!

.
All the highly-technical discussion aside, a narrowband digital
audio transmission mode for HF amateur radio, using data compression
followed by other narrowband sending techniques (as in modems faster
than 3k where the bit rate exceeds the bandwidth) for reducing the
bandwidth and using error-correction to deal with the distortion
problems caused in skywave propagation is not only practical, but long
overdue. Digital technology in amateur radio is handicapped in the USA
by laws that set limits on the DATA rate of transmissions because
systems in use when the rules were written assumed that the bandwidth
always had to equal or exceed the date rate.
A digital voice mode would have two advantages to the HF amateur.
First, the digital signals transmitted and received over HF could be
readily relayed over VHF or the internet, which would be particularly
useful in disaster communication situations.
Second, whereas an AM or SSB signal of your voice will be
understood as your voice if your neighbor's TV or telephone is tuned in
on it, a digital signal would come across as anonymous noise. If your
neighbor hears your voice on his telephone, he will want to shut you off
(more because you have something he doesn't have rather than because of
any real objection to the intereference!). If the only observation made
is occassional noise, he may not even notice it, or will try to fix the
problem on his own end (which is where it must be corrected in most
cases) if he does.

From said page:
"baud (Bd): 1. A unit of modulation rate."

"In some signaling systems, non-information-carrying signals may be inserted
to facilitate synchronization; e.g., in certain forms of binary modulation
coding, there is a forced inversion of the signal state at the center of the
bit interval. In these cases, the synchronization signals are included in
the calculation of the rate in bauds but not in the computation of bit rate.
Note 2: Baud is sometimes used as a synonym for bit-per-second . This usage
is deprecated."

I think I was more or less correct, Charles. As for the relationship between
bps <> baud I'll leave that to the telecoms specialists.

We have written a Toroid software package for use DC to 300 MHz. Many Years of research has gone into error corrections for the low perm cores , 200 & 360 degree coverage as well as SRF for series and shunt coils. Much of this has come about as a request from Micrometals. The pin point accuracy allows us to add a custom core feature for custom shaped cores, stacking cores side by side and machining custom phenolic cores from plastic, teflon, wood, ect...

> into a pint pot!

This particular pint pot has fuzzy edges: the signal to noise ratio. If you use a symbol-to-bit ratio greater than one, you obtain multiple bits for each symbol that you can decode out of the comms channel noise. Given a good S/N, you can get very much more than a quart into the pint pot of fixed comms links bandwidth.

Eg. a 56Kbps data stream comes into your analogue modem over the standard 3.1KHz-wide PSTN channel. QED. (Hmmm, I wonder what the actual symbol rate is.)

Rich.

2141. Upgrade Older PK-232 For PACTOR?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-10 00:00:00 UTC
From: leigh@rain.org
Message-ID: <6j34krin1@news.rain.org>
Source record: 24216

I've got a PK-232 MBX TNC that has the July 1990 firmware in it. I bought it used, and the manual that came with it is for a 1987 version, so I suspect mine has been upgraded.

Several years ago I used it to make HF contacts using AMTOR, RTTY and HF Packet. It worked poorly on HF packet, but on AMTOR I had fairly good luck. However, as I'm usually using crummy antennas (long wires, too-close dipoles or mobile whips), I had a lot of complaints about RFI distorting my tones.

Recently I've started to use it again, and am finding out that PACTOR is becoming the dominant mode for HF, and I can't work it... I've been told that Timewave (who bought the line from AEA) has a PACTOR upgrade for around $100.

Question: should I go for the Timewave upgrade, or buy a new multi-mode TNC? Do the newer TNCs have better shielding than the old PK-232?

TIA and 73 from Leigh Marrin/KM6JE.

> what the actual symbol rate is.)

The symbol rate is 8,000 baud. A 56kbps link works by
using the digital network to send digitised levels to the D/A
convertor at your local exchange. The analogue signal only
exists on the twisted pair from the exchange to your modem
(the "local loop"). If you have a cable telephone this loop
only reaches as far as a street cabinet. This loop isn't limited
to 3.1 kHz and can carry several megabits/s under ADSL schemes.
(Your point about S/N ratio is true; you've just chosen the wrong
example :)

NG trimmed.

I've just looked it up and you're 100% right -- oops, bad example, thanks for the correction.

I knew that xDSL takes advantage of the very much higher real bandwidth of the local loop, but being an ISDN sort of person I never considered that 56K uses the same approach (my last modem was a 9k6 :-). So, that explains why people get such variable performance from their 56K modems --- they're at the mercy of not just the varying S/N but also varying group delay and other nasties that occur at higher symbol rates and cause even more inter-symbol interference.

OK, a follow-on question then: for modems that stick within the standard bandwidth of the PSTN channel (which presumably means those up to 33.6Kbps and slightly higher for a few odd ones), what's the maximum symbol rate they can achieve? And, is there a minimum S/N specified by the network operators?

Rich.

2146. Re: Digital voice transmissions on amateur radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-10 00:00:00 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <01bd7c56$fd260180$LocalHost@default>
Source record: 24221
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc,rec.radio.shortwave,uk.radio.amateur

The useable bandwidth of the telephone line between my modem and the digital telephone exchange is more than enough to carry a TV picture. Certainly not limited to audio frequencies.

Once inside the exchange, traffic is offered time slots in an extremely wide bandwidth, not a bandwidth slot for the whole of the time a call is in progress.

But read C.E.Shannon's classic paper on "Communication in the Presence of Noise". Bell Telephone Monograph B.1644. Shannon says that even with ideal coding (which takes an indefinitely long time to perform even if you know how to do it and the coder has to wait till the whole message has been received before it can begin to code it) the transmission rate cannot exceed :-

MaxRate = B*Ln(1+ P/N) bits per second

where B is Bandwidth in cycles
P is signal power and N is noise power
and logs are to the base 2

Using common Logs :-

MaxRate = 3.322*B*Log(1+P/N) bits per second.

With P = N, Maxrate = Bandwidth.

With P/N = 10, Maxrate is only 3.5 times bandwidth and there is a limit to the useable amount of power.

In practice, actual rates fall considerably short of this ideal.

And you can't cook the books by using error-correcting codes because the amount of lost information which is recovered is very nicely balanced by the extra time required to recover it. Again, in practice, more is lost on the swings than is gained on the roundabouts. Either the error rate increases or it takes longer to send the message or the bandwidth must be increased.

The bandwidth does not limit the baud rate. It is quite possible to force
a 9600 baud signal through a 1200Hz bandwidth for example. The result
of doing so is substantial intersymbol interfence, but this does not stop
you recovering the signal accurately.

>The relationship between bit rate and bandwidth depends on the

>side, even 56K bit per second.>

(I assume you mean line side when you refer to DCE side)

Only older modems use 2400 baud. e.g. V29 or V32bis.

V34 modems use a variable baud rate from 2400 up to 3429 depending
on the speed they are running. The 56k (V90 now) modems operate at
8000 baud in the 56k direction. The basic signalling element is an 8 bit
pcm sample from the 64k digital stream used by the telephone company.

Yes, we can only approach the Shannon bound to within about 4 db
with current technology. But the typical telco link has considerably
better than a 10 db SNR. It is more like 40 db. The Shannon bound
is generally not the limiting factor. The limiting factor is differential
group delay. That smears the symbols into each other and limits
us to much less than the Shannon bound. Telco modems use
training sequences to compensate for this, but they are imperfect.

TAPR's handling of the frequency list has just been a joke so far.
They either:

1. don't have any information for that area

2. have very old and outdated information

I might also add that they are using Java which means that many
people cannot read their incorrect information anyway. A blessing
in disguise.

Your notation is contrary to standard mathematical notation.
"Ln" means "logarithm base e" to everyone in the world (where
e is Euler's constant). If your log is base two, then you
need to indicate it as such: log
2

Please set your followup-to line to just r.r.a.digital.misc.

Message-ID: <6j8st6$l61$1@news.goodnet.com>
Source record: 24140

A more common symbology is:

C = B LOG2 (1 + S/N)

Where:
C= Channel Capacity in bits per second (bps)
B = Channel Bandwidth in Hertz (Hz)
S = Signal Power in Watts (W)
N = Noise Power in Watts (W)

The reason I like these associations, are that I can remember them,
whereas P for signal power would be fairly obtuse.

No reason to bring Euler into the argument, I'm sure Ln was
just a typo since were talking about bits... :-)

I suspect that they will be in development for the rest of the year. Not
because
I know, just a prediction since it is being done part time by a very few people.

I'm sure it will be a very nice product, but it's still several years off.

> what the actual symbol rate is.)

This is not true. The 56k standard creates signals _wider_ than 3k1Hz!
That's essential for it to work. It violates the niquist rule, and changes
state 8000 times per second. The switching center digitizes this signal,
and obviously doesn't apply hard anti-aliasing filters (these would
effectively force 56k modems to fallback to v34).

The big problem of 56k modems and their lengthy connect is to find out
which voltage level the switching center translates into which binary code,
as well as to exactly synchronize to the digitizer's 8khz clock (both of
which is done without help from the switching center itself)

The copper twisted pair cable from your modem to the switching center is
not limited to 3k1Hz and therefore does not attenuate the 56k signal (after
all ISDN and other services come via the very same type of cable, too).
Most amplifiers or 10-POTS-subscribers-on-one-cable-multiplexers however
would do so. They usually are designed with the minimum bandwidth
(k3-3k4Hz) in mind.

> is there a minimum S/N specified by the network operators?

Most modems use symbol rates up to 2400 baud, v34 uses 2800 Baud, and some
(few) may even use about 3000 baud.

Telephone lines usually have 30dB S/N.

> 360-degree wave (I say "or more" because in reality, two samples would
> actually recreate a square wave when converted back to analogue).

No! When you sample a signal, you remove all spectrum components above nyquist (half the sample rate) with an analog filter (anti-aliasing filter). The highest possible frequency contained in the digital output (near half the sample rate) will _in_fact_ be represented by (almost) only 2 sample values per period.

When the digital signal is played back analog, another filter is required. It removes all components above nyquist (half the sample rate), and is called anti-imaging filter. It removes all spectral lines that make the "square wave" look "square", ie everything that distinguishes it from a sinus wave. All this "everything" that has been introduced by the time discrete storage is violating the "no frequency above nyquist" citerium and can therefore be split from the user signal.

This is no big deal and known since long time. All soundcards and DSP equipment use this technique. It is definately not necessary to represent the period by more than 2 samples "in reality" (note that the user frequency has to be (at least infinitesimally) _below_ nyquist).

> Microsoft's ADPCM

Well, Micro$oft did not actually invent ADPCM, nor the mouse nor the graphical user interface. While at it, they also didn't invent multitasking nor multimedia, ... They didn't even invent "good marketing for poor products" although that's what made them what they are now.

^^

Marc, your comments seemed misleading to me. You seem to imply that the
56k technology is using more bandwidth than is available on the phone lines.

I found a wonderful white paper describing the k56flex technology:

http://www.nb.rockwell.com/K56flex/whitepapers/k56whitepaper.html

it explains how the new technology works without violating Nyquist or
Shannon.

The Crynwr packet driver collection
(ftp://oak.oakland.edu/pub/simtelnet/msdos/pktdrvr/pktd11.zip) contains a
ibmtoken.com driver which looks like it may be what you want.

We have written a Toroid software package for use DC to 300 MHz. Many Years of research has gone into error corrections for the low perm cores , 200 & 360 degree coverage as well as SRF for series and shunt coils. Much of this has come about as a request from Micrometals. The pin point accuracy allows us to add a custom core feature for custom shaped cores, stacking cores side by side, ferrites, non Micrometal parts and machining custom phenolic cores from plastic, teflon, wood, ect...
Down load a demo or just view the software main screen at our web

Using APRServe and javAPRS, it will be possible for those souls unfortunate enough to make it to Dayton this year to view the APRS activity via the WWW:

http://www.aprs.net/dayton.html

For those that are unfamiliar, javAPRS is a version of the Automatic Position Report System (APRS) written in Java, allowing display of APRS data from within a web browser. APRServe is a Macintosh program which serves as a hub for RF to internet gateways, at any given time there are 20 or more such sites online, feeding data to the system. The result is live APRS data from all around the country, at any given time between 800 and 1500 stations are visible.

Source record: 24153

Hello Cal,

I'm a SWL and I use my SoundBlaster to decode SSTV, Rtty, CW, Packet...And
it works very well !

For Rtty i use BTL 1.5 (Blaster Teletype) and for CW I use MRP 37.

You can find these software (and more) on this site :

http://ourworld.compuserve.com/homepages/hffax

BTL is freeware. You will find a demo version for MRP37 : the demo lets you
record a cw modulation. Afterward, you launch the player to read the cw
decoded. The registered version decodes in real time. FYI, I bought it :-)

One thing advised in all sound card based software, is to shunt (connect
together) the right and left audio channels inside the audio connector.

Hope this helps,
73, Philippe

From: ggrey@nojunk.ihug.co.nz
Message-ID: <35597050.16620682@newsource.ihug.co.nz>
Source record: 24154

Hi,

I am trying to get TPK to run under PC/Flexnet. Anyone know the
configuration required?

I have set up TPK.CFG as COM2, addr=0x2f8, int=0xfd, speed=9600.

I am testing under bootup DOS mode (F8,6 of Win95a).

This is my basic startup file. Error control has beem ommitted.

```
flexnet 60
smsbc -tc:2
flex
smfsk96
fset mode 0 9600c
fset txdelay 0 35
smmixer /s:mic /o:-12
tfemu -b:40K
tpk
```

PC/Flexnet works very well with the Baycom terminal emulator BCT.

Any help would be most appreciated.

The 56k schemes require a digital connection from the sender to
their exchange (this is why the 56k path is only from the ISP.) The signal
is not digitized at the sending exchange; it is generated digitally and sent
down an ISDN line. The Nyquist criterion is not violated.

Non-digital rec.radio ng trimmed.

2181. SA Watch 3.20 released w/TAPR DGPS Reference Station support

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-13 00:00:00 UTC
From: Stan Huntting <stan@sni.net>
Message-ID: <6jdfiluus1@news-2.csn.net>
Source record: 24157

SA Watch 3.20 with TAPR DGPS Reference Station support is available for download from http://www.sni.net/kawin/

SA Watch allows you to monitor and analyze the wandering that your GPS receiver appears to do when it is at a fixed location. The major component of this wandering is SA - Selective Availability - DOD-speak for the deliberate degradation of the accuracy of your GPS signal. But there are other factors that influence the accuracy of a GPS position fix. SA Watch lets you see these graphically and statistically.

New features in version 3.2 of SA Watch include support for multiple, named, reference points; direct entry of reference point coordinates, selectable HDOP break points and elevation display. Version 3.2 offers full support of the TAPR DGPS Reference Station in both GPS receiver and DGPS reference station modes, including support of the high accuracy clock signal for system time-keeping.

For more information on the TAPR DGPS Reference Station see http://www.tapr.org/

Timewave support the PK-232 since AEA went bust, have a look at their
Web site. Upgrades after May 1993 had Pactor as standard but if your 232
is really old I think you might need a daughter board to carry an extra
EPROM, again check with Timewave. PC-Pakratt for Windows is OK, works
fine with Win95, or try XCOM, it's shareware and supports rig control as
well.

2189. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-15 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6jgqjo$lsa@news.Hawaii.Edu>
Source record: 24165
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.digital.misc

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

2191. RTTY Terminal info

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-15 00:00:00 UTC
From: EC Therapy <docshok@sunlink.net>
Message-ID: <355CB772.CE9005C4@sunlink.net>
Source record: 24167

I was given a terminal unit, but no booklet was included.... I would like to get into RTTY, so if anyone could help, I would appreciate it.

Markings on the front are " Flesher Corp" TU-170 Terminal Unit. On/ Off and Send/Rcv Switch on the left.... Auto Start section with threshold control on right.

On the back, there are several plug-in connections. Onte for the transmitter, one for CW key, and one marked "LOOP"

Below this is a terminal strip w/screws..... from left to right marked Ground, rcvr audia, Demod output, Loop Keying, Loop monitor, AFSK Keying, Scope Mark, Scope Space, Ground..... THe connections marked demod output and look keying are shunted, and the loop monitor and afsk keying terminals are shunted.

Any ideas on how to get this on the air????? email me or post here.

Thanks,

P. Troiani

First, see if you are getting any AFSK audio out of the TNC. Run the AFSK signal through the audio stage of an old junk FM radio or something and you should hear it going "beedle-beedle" on transmit. If you have anything there, and the rig's mic works ok on SSB or AM or DSB or whatever, maybe you need to adjust the TNC's output level... I know the PK-232 uses a pot accessible from the back panel. Adjust this until your power output just barely peaks, then turn it down to about 80% of that level. It could be you are just not driving the TX audio enough.

If you are NOT getting any audio out of the TNC, check your terminal program options... maybe TX is disabled, or AFSK only could be disabled.

I don't know how many pins your mic connection has, but the fewer the better for what I am about to suggest. Turn the rig off, and figure out which pin is ground with your ohmmeter. Connect your TNC cable ground to that pin. Now, once you KNOW your KAM is putting out the audio, ground your PTT pin and poke around the other pins until you see your power meter, SWR meter, whatever jump. Try not to short any pins out. When you get a good response out of the meter you probably got the TX Audio signal hooked up right. Make the changes to your permanent connector, hook up, and go for it. It could well be that even though your rig uses an identical mic jack to a familiar rig, that the wiring is nevertheless different.

By the way... you mean the TX light on the rig, or on the TNC is lit? If there is no indication on the rig then you need to make sure that PTT is being closed, and that polarity is compatible. Usual practice is that PTT will show 12VDC on it, and grounding it enables TX, just like the KEY line. Check to make sure there is no funny stuff going on here. One way to find PTT is to check for continuity between the pin you know is ground, and each of the other pins in turn while you key the unplugged mic. If you have only a 4 pin mic

jack, your other two pins will probably be +VDC (not necessarily 12... my rig has regulated 8VDC to the mic) and TX audio. Calculatus Eliminatus, as they don't say in Latin.

Well I have covered all the bases I can think of. Hope something helps.

2210. Help with MRP373 demoversion

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-17 00:00:00 UTC
From: Cal Kutemeier <ckuter@ix.netcom.com>
Message-ID: <6jllf3$hnu@dfw-ixnews7.ix.netcom.com>
Source record: 24177

I am trying to get MRP373 CW decoder to work with my SW radio. the program comes up but the signal strength graphs at the top and middle of the program show nothing. I am not able to save any file for later play, which is my understanding as to how the demoversion works.

I will appreciate any help. thanks

Cal

AZDEN is selling what you offered.
http://www.azden.com/pcs73d.htm is the URL of the product, but written in Japanese! AZDEN is also in US, but no information has displayed in AZDEN-US Web site.

Of cource, this TRX is tuned for Japanese bandwidth(430-440MHz), I don't know that is capable for bandwidth of UK.

Hope it helps,

The SCS site (which I agree is rather good) will also let you
subscribe to a pactor mailing list. This I did last week. I haven't
had any traffic from it yet...

There is also a general pactor mailing list, extremely dormant, which
I also subscribe to. Try mailing: owner-pactor@qth.net

It would appear pactor operators do most of their typing on the air,
not on the net.

I can't recall ever having seen a pactor FAQ anywhere. Hope this helps
Jim....

I am investigating the possibilities of replacing analog circuitry in conventional VHF/UHF receivers with digital equipment. The implementation of a direct conversion (no IF) receiver is of particular interest. The use of MATLAB based rapid prototyping tools for the development of such a receiver will be evaluated. I would appreciate any directions to either paper or online references for more information on this subject.

I've just sold a UHF MC80 for 15 quid - bad luck.

A Storno CQM 5662 goes quite happily at 9k6, and we also use Kantronics
D4-10 radios for 9k6 too. The latter is capable of 19k2.

Cheers !

Gareth.

Should we also tell him packet BBS suck almost as bad as TCPIP over radio?
Maybe he'll replace that service with the internet too.....

To the person needing help.... I wish I could help you, but I don't know
anything about your area. Have you talked to a local guru to see if your packet
system is properly configured? It may be that if some routing variables are
incorrectly set, you may be tranmitting what looks to be good and right IP
packets, but they may not look to be so to the switch you are getting into.

I honestly do not know why I am replying to this....but here it goes....

Our founding fathers actually expected the government to probably get out of control, and wanted the people to have the rights to gain it back, "The right to bear Arms". The right to bear arms is "necessary to the security of a free state". The problem being you may find this to be a "free state", but many of us are finding it increasingly restrictive.

As a matter of note, most world dictatorships and monarchies start by relieving the public of there weapons so they may seize and maintain power and control. Its in the history books, and in the news.

I do not own a weapon, have no immediate desire to purchase one, but find that most anti gun ownership lobbies to lack a logical basis, usually spouting gun related deaths without mentioning that if a gun was not available a pick axe might have been used to the same affect.

Regards

Christopher Cox

PS Sorry for the inconvenience as am replying to a post that Mr. Fisher has linked to many newsgroups.

Take your foot out of your mouth and look into the meaning of militia, not to mention "the right of the people" portion of the ammendment. Who do you think these ammendments were written for but individuals?

Was given a SOAR corporation, Japan, Digital Multimeter model number
3025 in mint condition, case and all. It has everything but the manual.
I would like to get one. I have looked for the company on the net with
no luck. Any help or leads would be appreciated. Thanks.

How many of the estimated eighty thousand to 2.5 million persons that have used a gun per year in defense of themselves as reported by the NCVS and others are you willing to sacrifice to those that would have done them grievous bodily harm? Would you tolerate the increase in violent crimes and deaths as long as the potential victim couldn't defend themselves with a gun? Are you satisfied that the increase in deaths caused by violent criminals will justify making guns illegal?

Yes!
There are a some programs that convert the outputs of a modem-driver
like
TFPCX or TFX to a serial line.
On the folowing site you will find PCTNC. (I tested it with a BayCom an
it
woks fine.)

I just installed one of those for a buddy of mine, who picked one
up used from a radio shop. He was in the same predicament as you -
he didn't get the manual or any info. Fortunately, CES has the
manual on line, so you can access and print out the whole thing:

http://www.cesusa.com/support//program/510sa.htm

The only difficult part about legally running an old 510sa is that
the chip used to store the callsign for the CW ID is obsolete.
The chip required is a blank 24SA10N. CES can program it for you
if you can find a blank one to send them. The stock 24SA10N
included when the unit is purchased is programmed to send OFF in CW
when you send the shutdown code. Apparently the unit will not
function without the 24SA10N installed, however we didn't try it
to find out.

The 8870 tone decoder chip is becoming quite hard to find, and the
unit my friend purchased had a "202" installed in its place using
a little adapter board that plugged into the 8870's socket. It
looks like it came that way from the factory.

It's an excellent unit though, and he's very pleased with it. The
vox-sensed variable sampling rate works fantastic when set up
properly. The two-digit "security" code for access ain't to
secure, though!

Best Wishes, Alan - VE3NNM

Have a look at the following site:

http://www.qsl.net/pe1nib/index.html

The page supports the "DXL" modem emulator for the IBM-PC, and
there is software listed for some other computers, also. I can't
say if your particular 286 is fast enough for the application -
I've seen 286s from 6 MHz to 20 MHz, and I haven't tried them all!
The circuit is simple enough to build, but I have no idea how much
the software taxes the slower micros or what the minimum uP speed
is to keep up with the demands for processor time. The computer
interface section can also be wired into an old BayCom-style
1200bps modem in addition to the 9600bps modem described on the
Web Site.
Best Wishes, Alan - VE3NNM

The worst ones, of course, are the "amateur telephone" gun owners, who get on the phone and say "Bang, I got you this time!" to each other to no point whatsoever. After they hang up their telephones, they are both still alive to engage in "amateur telephone gunplay" over and over again. These persons have no sense of shame or common decency.

No actual shots are fired.. They just get on the telephone and "pretend" that what they are doing is really gunfighting.

average'Average' means being run-of-the-mill,
mediocre, insignificant, an also-ran, a non-entity.
'Average' is the top of the bottom, the best of the worst,
the bottom of the top, the worst of the best.Which of these is you?
Being 'average' is the lazy person's cop out,
it's lacking the guts to take a stand in life;it's living by default.
Being 'average' is to take up space for no purpose,
to take the trip through life but never to pay the fare.
Being 'average' is to pass one's life away with time,
rather than to pass one's time away with life.
To be 'average' is to be forgotten once you pass from this life.
The successful are remembered for their contributions,
the failures are remembered because they tried,
but the'average', the silent majority, is just forgotten."

No, nor does Bank Robbery constitute a major number in violent crime
related deaths.

> No kids ever killed teachers and students with a pick ax.

Really...I find that surprising, world wide? How about Rwanda?...BUT if you
do your homework you will find world wide that violent crime related deaths
is not attributed to gun ownership...indeed just the opposite was found to
be true. A fellow at OSU finished his findings last your if you are
interested. It is gruesome.....

Take the 'receive audio' from pin 16 of the TBA 750, and the 'transmit audio'
is applied through a resistor of between 4k7 and 10k to the varactor diode
across the 'transmit' crystal.

Cheers !

Gareth.

2247. Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-19 00:00:00 UTC
From: mailer_daemon@wlio.com
Message-ID: <6jrth9$t2m$0@208.10.1.92>
Source record: 24119

Does anyone know if there is any packet program which will allow me to quiz a Davis or Pete Brothers weather unit and then transmit the information as a block of data? ie:

Time: 08:16
Date: 05/19/98
Temp: 68
Wind: SW @ 8 mph
Baro: 30.16 d
Humd: 72

What I'm trying to do is set up a digi in West Central Ohio with weather stations in a 40 mile radius reporting in so the weather patterns could be observed.

I was leaning towards APRS, but while in Dayton became disenchanted with it due to the fact that 1). it would not lay out the weather data in an easy to read format, and 2). it seemed that people were more interested APRS for seeing where people were.

One thought is to just establish the digi, on a 360 foot tall tower, and then let the weather stations to the sending, but I could take the data from the stations and process it at the digi on a small PC.

Has anyone done a hub of weather stations before?

Fred

How do You spell Burt Fisher?

> burt@innocent.com

I just ask myself, how a troll like You is allowed to have 'innocent'
contained in Your e-mail address.

~~~W4ABC Writes...

Read those words and choke Burt. Knowing that you come from an overprotective (overbearing) anti-gun state like Massachusetts, I have no doubts who does the thinking for you Burt. I was born there, and I'm not looking back.

My brother still lives there, and he tells me that there is a proviso that states that if an intruder enters your place of dwelling, that you must first attempt to flee. Talk about "BULLSHIT." Here in Florida, you are already eating the wrong end of Mr. Mossberg's M590A1. It is not there to kill, but to "STOP" the unlawfull individual's entry into my home. Sometimes they don't live to draw their own gun though Burt!

Since we are talking about the rights of the "Individual," "Groups," "People," let's talk about one well known individual in history, that disarmed his country so that all would be safe from the ravages of the "gun." His name was non other than "Adolf Hitler."

Burt if you are serious about being "taken seriously," then may I suggest a couple of books that you may wish to peruse.

"More Guns - Less Crime" by John R. Lott Jr. The University of Chicago Press

"The Second Amendment Primer" by Les Adams Palladium Press

Let me tell you the story about this caveman that beat his wife on the head with a gun...

I don't know about the digital side, but there was a nice article about
zero-IF VHF/UHF equipment by Matjaz Vidmar S53MV in the proceedings of
the 12th Amsat-UK Colloquium (1997). Ask the micro-satellite guys at
Stellenbosch, they certainly have a copy.

Well, I recently got a wake up call. Tuesday night I was arrested in Newington CT outside of the ARRL headquarters. Apparently, I was almost naked and assaulted David Sumner as he left work for the day. I say apparently because I was very, very drunk and remember nothing but throwing my clothes out the window on I-95. In addition to assault and indecent exposure, I face DUI charges and illegal possession of a firearm. God only knows what I intended to do, but there was a pawnshop receipt from a Boston area pawnshop, and a box of rifle shells. I want to thank all you guys for not letting me get by with my trolling and relentless ham bashing. I realize now that I have led a frustrating, boring life, and with the help of the treatment program my school's EAP has sent me to, I hope to pick up the pieces of my life someday. It all went wrong after high school, when I was no longer president of the ham radio club at South Dennis High, and couldn't really cut it in college. Ham radio was my life, I had no balance, so eventually, when I realized how empty my life had become, I lashed out. I am truly sorry if I have caused anyone here any pain or anger.

Burt

Why continue to respond to this lonely and sad individual? His only joy in life seems to be to get a rise out of YOU. Rebuffed in his attempts to have normal conversations with other humans, he resorts to a lame form of Cybersniping. And it's the same old song each time.

And he's not even a SKILLED flamer. If he were, I'd at least respect him for THAT. He's a twinkie. Don't give the dweeb what he wants. Bah -- let him go masturbate on the IRC with other dinks like himself.

You can take any dictator. This is certainly the most extreme (and most undemocratic) way of a government to control "its" people.
You should be careful, however, to compare the government's monopole of using force, as it is used in (quite democratic) countries like Switzerland, Germany or Great Britain with a dictatorship like Nazi-Germany. It is rather arrogant to condemn any idea other than Your own one. The American system of justice may be one way to go, but there are other democratic systems in the world, which realize the same idea of a free society in a slightly different manner.
BTW, do You have a reference for what You mentioned above? I have never heard, that Hitler ever seriously hided his true intentions, why he wanted to disarm the "man on the street" (except in his and Goebbels propaganda, which You won't count much on, do You?). I'd be really interested, where You have that idea from.

Regards

Robert

Yup. Knives, and simply threats, are also highly popular, and
effective.

>No kids ever killed teachers and students with a pick ax.
>

Don't count on it. Here, in Rochester, the weapon of choice to kill
teachers and students is also the knife. Unfortunately, it has proven to
be a highly effective one.

Actually, the National Socialists, though they were far from Second Amendment-type purists, considerably loosened gun restrictions in Germany compared to the previous "Social Democratic" regime. Just compare the 1928 and 1938 laws. (A book has been published which prints the two laws side by side, so they can be easily compared. It's called _Gun Control in Germany, 1928-1945_ and I think Noontide Press in California, among others, has it. It is also for sale at a lot of gun shows.)

Guns were widely owned by private individuals in Germany from 1933-1945, but were required to be turned in to the Communist and other Allied authorities when the occupation governments were set up after the war.

....

....

I'm not necessarily disagreeing with you re the Swiss and the Americans, but this "democracy" bit is a poor use of the language.

Switzerland and the United States are republics, and have constitutions for a very important reason -- to protect us from the tyranny of the majority; to secure rights that no majority and no legislature can ever take away, no matter how large or passionate the majority is that wants to do so.

Democracy and tyranny are perfectly compatible. It's called mob rule.

Democracy and freedom are mutually exclusive.

I'll take freedom.

Cheers,

Kevin, WB4AIO.

Alan, Sri to post a letter with your name as the subject but could not think of a quick way to get ahold of you. Could you tell me more about that CES 510SA you worked on. Specifically how or if you did get around the CWID thing. I've been making calls and had a friend in GA look thru his new copy of IC Masters and could not find the TBP24SA10N chip and failed to mention an equivalent. I do have the 8870 chip so I just need to find a work around for the CWID. I do not do alot of VHF or repeater work but seems to me that if I am the only one using it and it only listens a voice ID of my call would be enough. Now if someone else uses it the would have to ID there's and my call for the patch. But I would have to read the regs. Does the CWID chip have to be in in all cases of operation? Any help would help. hi hi. Simon.

The argument is about the definition of people.
I believe it to be we the people as in every citizen in the United
States os America. Therefore Congress can not pass a law which
infringes on ME as a person covered in the group called people.
So in that context the second amendment bars congress from passing
ant gun law.
How did a debate about guns get into the newsgroup?

It is against the law to sell ivory...but criminals do
It is against the law to sell cocaine....but criminals do
It is against the law to kill or steal...but criminals do
It is against the law for convicted felons to own guns...but they still do

Outlawing guns will have no effect on criminal use or aquisition of weapons.
It will only prevent law abiding citizens from owning guns. It is a
documented fact that private gun ownership thwarts thousands of crimes per
day.

Curtis .. N5HDQ .. http://wf.quik.com/n5hdq
I can't think of anything witty to say here.
Oh well, no one is perfect.

What do you know about what is scheduled to happen
in November as regards the Brady Law?

Do you remember that back in 93 when it was being
debated it was presented as a 5 year Law that would
prevent handguns from falling into the hands of
Criminals and fade into the sunset in 98 ...???

Not so. It was in the original language that five
years after enactment that the word handgun be
replaced with firearm, and an instant background
check be conducted for the purchase of a FIREARM.

It seems that the law has been modified by various
agencies (is this legal in itself) to the point
that a National Firearm registration program will

be attempted. This does not pertain to new guns alone as if you take in a gun for repair a background check is supposed to be ran on you.

How do you feel about a law that was ruled, at least in part, as un-constitutional being beefed up to suit Clinton and his gun grabbing Corps..?

There is a bill (H.R. 2721) going around on Capitol Hill now that would kill Brady cxompletely should it become law. It needs help now as there are only four signed on to it now.

If you want to help you could contact your people in Washington urging them to sponsor H.R. 2721.

2271. Slow PTT using TPK with BAYCOMM

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-20 00:00:00 UTC
From: "ppakotze@firga.sun.ac.za" <ppakotze@firga.sun.ac.za>
Message-ID: <356349F7.1D22@firga.sun.ac.za>
Source record: 23999

I am using TPK with a Baycomm modem and a KDK 2m radio. The problem is that the PTT of the radio is to slow for the modem. If I try to connect to a bbs it is as if the bbs doesn't here me. I have keyed the radio with the mic ptt before I give the connect command and then the bbs comes back to me. It is obviously a bit of a hassle keying the ptt by hand everytime I hear the bbs answering. Is there a delay or timing parameter I can set up either in TPK or in the BAYCOMM driver? Or if this is not available is there a hardware solution for the problem?

Any help would be appreciated.
Direct email replys are also welcome.

on 6m anything is allowed. the bandplan is not law <yet>
IF the suggested bandplan invites MS, then who is to say
what mode is or is not available. There is SSB ms, CW ms
FM packet ms was talked about in a recent mag <>sorry cannot
remember which one....

2273. HamCom decoder, and POCSAG

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-20 00:00:00 UTC
From: ki5xp@mindspring.com
Message-ID: <6k0a35$2i8_002@news1.newscene.com>
Source record: 24001
Cross-posted to: rec.radio.scanner,rec.radio.amateur.digital.misc,rec.radio.amateur.misc

I recently went to the HamComm decoder page and noticed the increase in price. So at Dayton, I purchased the board from FAR Circuits to construct the decoder, completed the project and it seems to work fine in both JV Fax and Hamcom, yet is not recognized at all in either POC32 or POCFLEX. Anyone have any ideas as to what might be the problem? I noticed that the schematics for the board as they are to be constructed ties pin 6 of the 741/941 to pin 6 of the DB-25 which is DSR, yet the diagrams on the POCFLEX page shows that pin 6 of the Op Amp should be tied to pin 5 of the DB-25 pin, which is shown as CTS. I've cut the trace to 6 and jumpered it to 5, yet the board still doesnt work, and although Poc32 allows for both DSR and CTS on the hardware settings, it doesnt recognize the board, nor does it decode data. PocFlex's little "spinny" thing in the top corner doesnt spin, meaning it's not working correctly either, yet HamCom's nifty little spectrum scope clearly shows that it is correctly recieving the mark and spaces, and although it hasnt actually decoded "correct" data, I blame that on lack of knowledge of the program.

I've check all configs on both Poc32 and PocFlex, and neither seem to help, anyone have any ideas?

Charles

You didn't say where you are getting your audio from, but you must tap
it from the discriminator unless you are reshaping the audio afterward.
There is just too much filtering that takes place to insure that POCSAG
or FLEX will decode accuratly if you take it from the speaker or
headphones. 73s Mike ka3jjz@erols.com

So I didnt make contact with a soul today after 1 hour of calling every 15 seconds. If you want a nice clear frequency this has to be the one! Theres a band opening about every evening the past week or so. I think I'll just keep calling until I get at least one connect. Everyone with 6 meters really needs to try this (Increase my chances). I worked a guy in Cala night before last with GOOD 5/9 signal. Cant see why packet wouldnt work just as well if not better.

Not another responce...but Yes!

The median demographic for ham operators is the following..
Middle aged white with above average income.
(read: $500,000+ net worth and three vehicles)
And what is that group's average belief system?
Republican, christian right wing, and paranoya theory reactionary.
Just listen to 3853..or now even 20 meters.
Why? The white power base in this country is loosing power.
The country is becoming browner. Get used to it.
And the gun ownership issue is just an outgrowth of the basic
fear and insecurity of people who are having their unchallenged
supremacy threatened. All the bravado is inspired by fear. All
the "loss of freedom" paranoya is fear talking. When you cannot
adapt to the new reality, you scream and yell and act as if
you are not scared. The truth is- you are.
Remember that nothing will protect you from a tidal wave of south
americans immigrating. You will know 30 words of spanish.

How about taking responcibility for the fact that- if your life
seems to stink- it is YOU that is to blame. It is not some guy and
his wife in D.C. of whom you have no direct knowledge. Of whom you
have been spoon-fed information by people with an adgenda. Unless
you indeed have ESP, your opinion is the direct result of a multi-
million dollar (and now tax dollar) campaign by the sore loosers.
(what a simple and overlooked concept! Huh!)
It wouldn't take 50 million to indite anyone reading this.
And if the whigs were "getting any", they would forget all about
those who were- and do the job they were sent to do. -I don't
know any attractive women who like crusty -teeth grinding paranoids
with bad attitudes. Go ahead, take a picture of your right hand
and put it in your wallet.

So...get your self tharapy flames fired up...but remember that
true personal power comes from within...you can't buy it in a gun
store, and you can't get it from a bible beater. Your investments
will pay out, and your padded ass will wither on a feather pillow.
So Shut Up.

Bob

PS: Repeat this tharapy mantra: Hillery is richer than me, better looking
than me, and smarter than me - and it doesn't bother me a bit.

If your next door neighbor chops down your antenna mast and makes a mess of
your DX, because you are interfering with his TV quiz programs, does this
entitle you to invade his property and empty your magazine into him, his
wife, his children, and anyone else who interferes with your hobby?

If I unloaded my magazine(s) on him, he'd be covered with ink and
newsprint. AND probably about 200# of old QSTs.

Come to think of it, that'd be a great way to get rid of a lot of old
publications.

In the U.S., data is allowed only from 28.0 - 28.3 MHz, with a maximum symbol rate of 1200 baud and a frequency shift not exceeding 1 kHz. Wideband FM is allowed from 29.0 - 29.7 MHz, but data emissions (including packet) are not allowed in this segment. (Ref. para. 97.305, 97.307, FCC regulations.)

One again guns are responsible for student deaths. If the gun did not exist do you think this kid would have gone to the cafeteria and tossed knives? The ham radio connection is that most hams have no guts and they are more likely to have a gun to "buy" their guts.

Please visit my World Wide Web Site, you have never seen a page like it. You will see:

1. A naked chic
2. An actual picture of Burt on the throne.
3. The writings of me and others on ham radio, hear a typical ham contact.
4. The warm side of K1OIK, hear me speak, see me with famous people.
5. A test for your SVGA monitor
6. Pictures of me and my family.
7. A Nazi connection in ham radio?
8. See now the future of ham radio.

Media is focusing too much on one violence.

As media broadcasts the violence, the situation becomes even worse
(you hear this and this is going on and so forth and some people think
it is normal to do such thing). Anyway... please don't focus too
much... you will make it even worse...

There was a research done regarding to the TV / movie etc. There was
a small community with no TV (ie. no freq to receive and no cables
either). After setting up the TV system (either freq or cable), the
crime rate raised suddenly by 2 times or more.

As for guns, I believe that the parents are responsible.
If the parents are responsible for their kids, the kids will be
responsible for themselves. It's natural. And amazing enough...
most kids (who get focused on medias) get guns from their family...

There are about 40,000 deaths do to DUI in the US each year. Obviously
cars are the problem. Should the government come to your house and
confiscate your car?

If the cars did not exist, 40,000 people who died last year would be
alive.

: do you think this kid would have gone to the cafeteria and tossed knives?

No, he might have left explosives (one of his "interests"), or thrown a
molatov cocktail, or mixed up a toxic gas from recipes on the 'net, or
driven a car into a crowd of students, or any number of other forms of mayhem.

If he had been thrown into jail when he was caught and arrested for
bringing a **stolen** gun to school the day before instead of having his
hands slapped and being sent home to his so-called parents, do you think
he would have been in that cafeteria?

Burt: unencumbered by the thought process.

And you are a shining example of one with no guts or brains.

Gun owners kill children and so do car owners. BAN ALL CARS!!

Hello folks, thanks for takeing the time to read this. I've been attempting to MAKE a Baycom modem work with my TS60 and/or IC820. I seem to be getting BUZZZZ, HUMMMM in the TX audio. I put a small cap in series with the audio out from the modem, this seemed to clean it up very well. Problem is it also reduced my drive audio to the point where I no longer can get 100 percent drive. Is there a PROPER size cap for this job, or maybe a better way to clean it up?

Burt has no guts to post his drivel on an appropriate news group
where he knows that he will be torn to shreds. There are plenty of
hams over at TPG for him to vent on. It is he that is the wimp and
without guts. I invited him over the last time he posted his rant and
I see that he hasn't had the balls to show up.

I'm a ham in Oregon. I DIDN'T APPROVE OF ANYTHING to do with shooting anyone. Thank you Butt Fisher for your kind, accurate portraying of how we here in Oregon feel about this tragedy. It's so nice to know you are interested and well versed in how we think. You know, there could easily be someone on one of these list that did know a person or the family of a person injured or killed by that kid in Springfield. But then, you are only doing your part to clean up the world, aren't you. Nice to know you care so...

Myself and most of my schoolmates had a history of killing animals when we were young......

Deer during deer season; fish during fishing season; hogs, steers, and sheep during fall butchering season;.....

...... so why were we in school in the first place?

What's your point?

This is a common problem. It's probably a ground loop, or connecting the
Mic input's "signal ground" to common chassis ground.

The easiest way to handle it is to put a small 1:1 audio isolation
transformer in the audio line between the modem output and the rig's
input. Radio Shack makes one--you can find it in the catalog. Just look
in the index under "transformers." It's about the size of your
fingernail, and wrapped in what appears to be green mylar.

Terry,

Don't blame Burt. It's common knowledge in New England he's got no feelings for anyone but Burt. The rest of us in the east wish nothing but the best for you folks out there where the tragedy occurred. No one would wish this sort of thing on their worst enemy.

Kevin, N1UYW

The POINT is please KEEP THIS DRIVEL OFF the antenna newsgroup.

Don't you guys have something better to do than spam the ham newsgroups?

It's one stupid thing after another having ZERO to do with ham antennas. If I wan't to read about either sides' whining and snivelling, I go looking for it. In the mean time, show us the consideration of keeping all this wacko bullshit off the newsgroup.

THANKS.

To the real participants of the newsgroup, my humble apologies, but I've had it with this stuff.

I would like to be able to run my packet station from my office which is on a Microsoft Client network via an Intel EtherExpress Pro/10 Ethernet adaptor. I would like to access my packet station which is on the network.

I have used the G8BPQ over com ports and I know it can be done over an Ethernet Adaptor.

Can anyone here offer any help on getting this going??

Hams support the Oregon shooting? Funny, I'm a ham, and a gun owner, but I don't recall showing support for it. Matter of fact, I think it's disgusting. To broadly label such thing against a GROUP is pretty hard to do and be able to back it up with facts.

My weapons are kept where I can get to them, but then I don't have kids to worry about. IN MOST CASES, parents ARE (SHOULD BE) responsible for the actions of their children. But, in this case if he killed them too, then you can't hold the parents other than for that which they may have failed to do PRIOR TO their own demise. Like the day before, when he took the gun to school and was thrown out, but hey, they may have been dead already too, at that time.

It is PEOPLE who kill, NOT THE GUNS. Just like when a drunk takes a car and kills. It isn't the car. Cars, guns, knives, baseball bats, bricks, pipes, etc. Any weapon of choice, does NOT have a mind nor a consciounce to make the choice.

But it is WRONG to say OPENLY that a GROUP supports such a thing. You are speaking for me as well by that statement, and I sir, NEVER support such a dastardly deed. Let me speak for myself, PLEASE.

DUI...hmmm.... sounds to me as if we should ban alcohol. No alcohol, no drunks, no drunk drivers, no DUI deaths. Yes, ban alcohol.

Oh, wait. Wasn't that tried earlier this century? Anyone remember the outcome?

2326. FlexNet - BPQ/BBS Serial Link setup

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-22 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <6k59gk$e2s@enews2.newsguy.com>
Source record: 24054

The following two-computer setup has proved satisfactory for
interconnecting FlexNet, TexNet, ROSE, IP, and NetRom networks.

This is similar to the setup shown earlier, but has been updated with
information provided by other, more knowledgeable FlexNet users.
Thanks, guys!

FlexNet node computer:
486-66dx, 4MB RAM, 1.44MB FD, 4 Serial Ports, Monochrome Video
Tigertronics BayPac BP-2 1.2kb modems (2)
Software: FlexNet 3.3e Node
\\
4.8kb full-duplex Null-modem serial link between 'BPQ and FlexNet
//
BPQ/BBS Computer:
Microchannel 386-20dx, 6MB RAM, 82 MB HD, 1.44MB FD, VGA video
No Radio ports on this machine, just the 4.8kb serial link to FlexNet.
Software: BPQ node and BBS software.

---- From BPQCFG.TXT on the BPQ/BBS computer -----

```
PORT
ID=Link Port
TYPE=ASYNC
PROTOCOL=KISS
IOADDR=3F8H ; COM 1
INTLEVEL=4
SPEED=4800
CHANNEL=A
QUALITY=0
MAXFRAME=1
TXDELAY=0 ; TXD of 0
SLOTTIME=100
PERSIST=128
FULLDUP=1 ; FULLDUP
FRACK=7000
RESPTIME=2000
RETRIES=5
PACLEN=230 ; Big Fat PACLEN

ENDPORT
```

From FlexTex.bat (FlexNet batch file on Node computer)

```
LH FLEXNET 60
FLEXDIGI
LH KISS 3 /i=5 <---- COM 3, IRQ 5 ( Serial Link )
LH SER12 1 <--\
LH SER12 2 <---- BayPaks on Com 1 and 2
FLEX

-------------------------------------------------

Parameters loaded in for FLEXDIGI, using TNC.EXE:

MY N5PVL 0 3 <-- Mycall with SSID's 0-3

MO 0 4800d <-- Port 0 4.8kb Full Duplex ( Serial Link )
P T 0 0 <-- Port 0 TXD 0

MO 1 1200 <-- Port 1 1.2kb
P T 35 1 <-- Port 1 TXD 350 ms.

MO 2 1200 <-- Port 2 1.2kb
P T 35 3 <-- Port 2 TXD 350 ms.

L 0 N5PVL-2 @ <-- Link to N5PVL-2 (BPQ node) on Port 0
L 0 N5PVL-0 @ <-- Link to N5PVL BBS on port 0
\
\_ The @ is for Non-FlexNet Link partners.

L 1 TEXNET $ <-- The $ is for a "Non-reliable" Link, Not Checked.

-------------------------------------------------

Why define two "links" on one port? This allows direct connects to those
two applications from all ports, with FlexNet being totally transparent.

C N5PVL for the BBS.
C N5PVL-2 for the 'BPQ node.
C N5PVL-3 for the FlexNet node.

In the BPQ node, the "BBS" command brings up the BBS.
In the FlexNet node, "M" brings up the BBS.
Or you can connect to the BBS "direct". C N5PVL

When you connect to the 'BPQ node or BBS, you can do so "direct" due to
the "Link" setup. It's as if the FlexNet node was not there, though
actually everything goes through it.

The BBS mentioned here could just as easily be a DX Cluster, ect. For the
purposes of this discussion, it's an "application". One is as good as
another.
The application could be left out, but I wanted to show how they are set up.

FlexNet will check the link quality to the BPQ node and to the BBS every
four or five minutes, if there is no activity on the links.
It does so by connecting, then disconnecting immediately. There is no way
to avoid this link check and still have a full-time, "transparent" link to
those applications. It does no harm, so don't sweat it.
```

In this case the link check is occurring over an RS-232 line instead of on the air. With Radio links to neighbors, these links checks are appropriate on "backbone" frequencies but should be avoided on User freqs. Use the method shown below for User freqs.

L 1 TEXNET $ <--- Link to TEXNET on Port 1 (Non-reliable, no check)

Allows users connected to FlexNet to enter C TEXNET and not have to know the outgoing Port number.

Normally, connected users would have to enter C TEXNET 1 in order to make that connection. (Port 1)

It also allows things like C TEXNET V N5PVL-3 no matter which Port the connect request comes in on.

The same type of Link works for NetRom neighbors, such as W5OYS-1:

L 1 W5OYS-1 $ <--- Non-checked Link to NetRom/BPQ neighbor.

Next time, special Links for ROSE neighbors.

Good Luck, Have Fun, and let me know how it goes!

The latest setup info is on my web site. (The page is updated when the node is.)

I agree whole heartedly, but when someone defames a whole group of Hams by coming onto News Groups they know we frequent, with such foolish statements, someone has to defend the group at large, in the same area. I've already made my point and stand by it. Case closed.......

2339. Internet Elmers Wanted

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-23 00:00:00 UTC
From: pschleck@novia.net
Message-ID: <CeD91.1830$t4.1592779@newscene.newscene.com>
Source record: 23932
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Based on data reduction and analysis of an ongoing log of actual compound subject/geographic queries of the Amateur Radio Elmers Resource Directory:

http://www.novia.net/~pschleck/elmers/

I've concluded that there is a need for Elmers in the following three categories:

- Elmers in geographic areas that do not appear at all in the Directory

The following U.S. States/Commonwealths/Districts/Populated Territories, Canadian Provinces/Territories, and those Countries representing the top-10 countries in licensed amateur population (based on IARU statistics), do not have any Elmers at all in my Directory:

American Samoa
District of Columbia
Guam
Iowa
Montana
Nevada
New Mexico
North Dakota
Puerto Rico
South Dakota
Virgin Islands
Wyoming

Manitoba
New Brunswick
Newfoundland
Northwest Territories
Novia Scotia
Nunavut (beginning in 1999, currently part of Northwest Territories)
Prince Edward Island
Quebec
Saskatchewan
Yukon Territory

INDONESIA (listed here for completeness; considering the political situation, I don't expect to recruit many Elmers from this country in the near future)
JAPAN

THAILAND

- Elmers in specific, frequently-requested, subject/geographic category pairs that do not appear at all in the Directory (at least at the time the requests were made; they might currently appear in the Directory, based on recent updates)

The following are the most needed subject/geographic category pair Elmers that did not appear at all in the Directory, based on an arbitrary "No match" query threshold of 3 or more. They are ordered alphabetically by geographic area, then by need. The number in parentheses represents the number of requests for such an Elmer since the compound subject/geographic query was added around mid-1997.

I've seen somewhere a thing called bpqether, which sounds like it
addresses this, but don't have any further information.

It's easy to access via ethernet when you run JNOS or Linux on your packet
station.

Curtis .. N5HDQ .. http://wf.quik.com/n5hdq
I can't think of anything witty to say here.
Oh well, no one is perfect.

What do you know about what is scheduled to happen
in November as regards the Brady Law?

Do you remember that back in 93 when it was being
debated it was presented as a 5 year Law that would
prevent handguns from falling into the hands of
Criminals and fade into the sunset in 98 ...???

Not so. It was in the original language that five
years after enactment that the word handgun be
replaced with firearm, and an instant background
check be conducted for the purchase of a FIREARM.

It seems that the law has been modified by various
agencies (is this legal in itself) to the point
that a National Firearm registration program will
be attempted. This does not pertain to new guns
alone as if you take in a gun for repair a background
check is supposed to be ran on you.

How do you feel about a law that was ruled, at least
in part, as un-constitutional being beefed up to suit
Clinton and his gun grabbing Corps..?

There is a bill (H.R. 2721) going around on Capitol
Hill now that would kill Brady cxompletely should it
become law. It needs help now as there are only four
signed on to it now.

If you want to help you could contact your people
in Washington urging them to sponsor H.R. 2721.

For more information and links to Your
Congressmen and Senators please visit:

Great Icom IC-R1 0,5-1.300 Mhz handheld receiver to sell,
it's new in the box with a lot of extra accessories and English
manuals.

I may sell for $250 (reasonable...) plus postage from Italy
($10/15) or I would swap with one old HP calculator
(65, 10, 10C, ecc.) only if in good shape and with owner's manual.

Greetings from Italy !
Gian.

The neutron bomb, but Jimmy Carter vetoed it. Also, you wouldn't have to
worry about whether or not Oregon had a death penalty.

What others tell me:

Hello Burt,
It is rather tragic to see the juvinile garbage coming from the USA in many area of Internet, including the amateur sections. Reading the comments from various so-called amateurs on the amateur newsnet leaves oh so much to be desired. The garbage is all and only from the US. I just picked out you by chance to reply. I would like to inform you and all your tunnel-vision US amateurs that a greater percentage of "hams" around the world work "barefoot" - 100 watts and quite often with not much more than a dipole and/or long wire.

...Calling CQ-DX is quite common on all international HF bands. It is quite possible because of all the drivel eminating on the "ham" bands in the US, you may rarely get to hear the rest of the international amateur fraternity. Perhaps - and I would be surprised if what I am to say were not true - too many American Amateurs treat the radio hobby as CBers treat and violate the CB bands....!

It is indeed unfortunate in that too many of your compatriots fail to grasp the fact that the whole world sees (Internet) and hears (amateur radio) so much drivel originating from the USA. While there are many good and highly skilled amateurs in the US, there would appear to be a majority who are nothing much better than the worst type of CB operator. During the Second World war there was a well known saying...."When the British were bombing the Germans ducked for cover. When the Americans bombed everyone but the Germans ducked." It would seem that saying still applies today. When US operators are on the Net the rest of the world turns off. And when you are on the Amateur Bands.....! Need I say more! You have my full permission to insert all my comments on the BBS Nets used by yourself and other US amateurs.

2351. AEA DSP-232 and Timewave DSP-2232zx

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-23 00:00:00 UTC
From: Suzanne & Roy Ogborn <SuzRoy@worldnet.att.net>
Message-ID: <6k893n$eaf@bgtnsc02.worldnet.att.net>
Source record: 23944

There was supposed to be an announcement at the Dayton Ham Convention about the trade-in deal from Timewave. I have not heard what was announced, but called Timewave shortly before the convention.

The latest was that they made a decision to offer $200 for an existing DSP-232 toward the new Timewave DSP-2232zx which was due out in a couple of months. The DSP-2232zx is supposed to retail (list price) for $599. It didn't matter if the DSP-232 was owned by the original owner or a secondary offer.

If anyone heard the official word, please post it.

Thanks!

I attempted to post this a few days ago, had some upload problems,
and attempted to cancel the message. Not sure how it ended up, so
I'm re-posting just to make sure this gets through...

Subject: Alan, VE3NNM
From: Simon Howell <showell@alaska.net>

> Alan, Sri to post a letter with your name as the subject but could
> not think of a quick way to get ahold of you. Could you tell me
> more about that CES 510SA you worked on. Specifically how or if you
> did get around the CWID thing.

<snip>

> Does the CWID chip have to be in in all cases of operation? Any
> help would help.

Howdy, Simon.

I apologize for not having an E-mail address. I dial into the
Internet connection at work for free during the off-hours, and I'm
not allowed to release the address for personal use. Been going to get
one of those free mail accounts somewhere, but haven't found one I'm
comfortable with. Oh well, maybe someone in the group can also help
you out if we make enough noise ;-)

I finished the install for my buddy almost a year ago, so you'll
excuse me if I'm a little foggy on some of the details with this
thing. My friend made a few phone calls to CES concerning the IDer
chip problem, and he was the one that told me it wouldn't function
unless the chip was on the board. I believe he was asking if he could
send in the chip that came with the unit to be re-programmed with his
callsign, and got the impression from the tech on the phone that the
unit wouldn't function if he took the chip out of the socket. The text
from the manual seems to create the opposite impression, though:

CWID ENABLE

If your station call sign is programmed into the CWID PROM (U22),
switch "ON" the ID ENABLE switch. If you are installing the ID PROM,
refer to the assembly drawing for proper installation. Setting the ID
Enable switch to the "ON" position without a CWID Prom in the prom
socket will cause a long delay prior to connect. (Please note that
installation of a programmed CWID prom requires that the prom be
inserted with its "notch" orientation opposite to that of other IC's
on the printed circuit board.

Now to me, this seems to imply that the unit will function, but the output will be silent during the period when the IDer is supposed to be active. If that's the only trouble, then no big deal. With the "stock" chip that came with the unit, the unit beeps - sends "e" (8 times, I think) for the ringout signal when someone dials into the patch's phone line, and sends "OFF" when you enter the shutdown code. There are also some error beeps that I can't remember the details of, right now. I believe this comes from the programming of the stock 24SA10N. I don't remember if the "ID ENABLE" DIP switch was on or off in my friend's unit with the factory 24SA10 chip installed, and it's 3AM so I'm not going to call and ask.

> work but seems to me that if I am the only one using it and it only
> listens a voice ID of my call would be enough. Now if someone else
> uses it the would have to ID there's and my call for the patch. But
> I would have to read the regs.

That's what my friend decided to do. He just says "This is VA3xxx accessing the VA3xxx autopatch", and then IDs again when he's done. I'm sure that's not 100% above board, but I'm pretty sure that Feds are not going to hang someone as long as they're making an honest effort not to hide anything. I'm not sure what your FCC has specified, but in Canada we are allowed to operate one station at a "fixed location", one mobile, and one temporary station under the same licence. My HOMEBREW simplex autopatch IDs with my regular callsign. You've got a lot bigger chance of getting static from a nosy Ham sticking his face in your business than hearing from the Radio Inspector anyway.

You might wish to build your own IDer, or assemble a kit. All you would have to do is find a point on the circuit board of the 510sa that changes state ONLY when it's time to ID or ring out over the air. You could use the sense point to trigger the ID sequence and keep the transmitter on the air for the duration. The best place to start looking would be right around the area of the 24SA10's socket. There is a nice circuit that uses (IF I remember correctly) a pair of 74154s and 3 555s to generate a callsign programmed with a diode string - the connection of each diode determined if each interval was a dot, dash or space. The audio output can be fed into the MIC line with the rest of the audio, and the level set with a pot. I wanted to persue this when I was working on the patch, but he was too excited about getting it on the air to let me play around. The circuit appeared in the old Ham Radio magazine a few times, if you're interested I can probably dig it up. It is no problem to haywire up on a perfboard or something. Another alternative would be to have the IDer not connected to the patch circuits at all - simply have a 555 or something automatically bring up the transmitter to ID every so often the way some repeaters do. The LED used to indicate patch use could also be used to disable the IDer from going off - if it hits its timing interval in the middle of a conversation.

Your best bet would be to go ahead and wire the unit up to a radio (you're going to have to do it eventually anyway) and start playing around. You'll find out where you stand with it soon enough. If there's anything else you need to ask, I should be lurking around the NG to read it.

Best Wishes - Alan, VE3NNM

Genie

A man found a bottle and was dusting it off when a genie appeared. The genie said, "I will grant you only one wish, what will it be?" After thinking a moment the man said, "Well, I have plenty of money, a nice house and a wonderful family, but there is one thing I would like to have: a vacation. I know, I would like to go to Hawaii, but I don't like to fly, and boats make me sick. What I want you to do is to build a bridge from California to Hawaii so that any time I want to go there I can drive." The genie replied, "WOW, do you realize what a tremendous request that is? That is over a thousand miles and across probably the deepest part of the Pacific ocean. Can you comprehend how much steel and concrete that would take? That would be a tremendous undertaking. Are you sure there isn't something else you would like to wish?" The man thought for a minute and said, "Yes. Please explain hams to me. They are so boring, they repeat things, they never show any guts and they hide behind their mikes. How can anybody have a life like that? The genie replies
"Will that be 4 or 6 lanes."

I like that Burt. I think it is funny, however I have been a Ham for over 25 yrs and very much enjoy talking to people all over the world. I don't think you can explain Hams anymore that you can explain life. There are too many aspects of the hobby to narrow it down to one simple answer.
I do enjoy most of your responses to other folks (most don't realize that they are the one being had).

David - W4DSM

Can we just drop all this crap. Guns are not responsible for deaths, it is the PERSON WHO PULLS THE TRIGGER. Just about all of the guns used to commit crime were stolen/untraceable, They are not legally owned. If you feel that this is not the case you are a total IDIOT. Read the facts of the cases not what the "news media" hypes. You will find the truth, not what they want you to see.

For one an inanimate object can not be responsible for anything as it can
not do anything by itself. Second point: if you can not think of more
efficient ways of dispatching a large group of people, you are far less
intelligent than the average criminal that , on average , have IQ ratings
in the double digit category.

Actually it's been traditional in the U.S. to run data on Lower SideBand,
and while modes like Pactor are sideband independent, the convention
for determining which sideband to use is just that a convention rather
than something mandated in the rules. Nothing stops you for example
from running LSB on 28.475 MHz in the rules applicable to amateur
radio. Of course running LSB there might lead to interference with
other hams running USB, and it is impolite but running LSB on an
empty band doesn't.

2381. Getting started with telemetry - looking for advice (Radios, Modems, etc?)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-24 00:00:00 UTC
From: Larry Rubanka <lrubanka@execpc.remove.this.part.com>
Message-ID: <6kae9d$8kv@newsops.execpc.com>
Source record: 23959

I fly small data collection computers in high power rockets. I'd like to start transmitting data to the groud in real time.

I've been reading up on packet radio, and various digital communications modes. I'm pretty experienced with "conventional" over wire data communications. Where I really need help is in the radio department.

Here's where I need some advice.

Band: I think I should work in the 70cm band. Does this make sense?

Transmitter vs Transciever: My application for the flight computer is transmit only (for now). Should I look for transmit only gear?

Power output: The computers fly to 10,000ft. I'd like to be able to handle higher altitudes/distances. Since the transmissions are in the sky, line of sight, I believe I do not need high power output. What kind of power might I need? I expect to put a good antenna on the ground with a good receiver.

Modem: I don't have packet or tcp/ip software for the flight computer yet. I'd like to keep things simple in the beginning, so I believe I should start with a simple serial stream (ie. no packet or tcp/ip). Any recommendations for a small low power modem for the transmitter.

I've been looking around at off the shelf data radios and have run across Tekk radios. They have a series of radios KS900L, KS960L, and KS1000L. These radios run data up to 19.2Kbps. They tune 430-450Mhz, and put out up to 5W for the 1000 model, 2W for the 900 and 960. They cost between $150 and $200 US.

I may want to try some flight televideo later on. Would radios like the Tekks work in an ATV application?

I'm comfortable building kits. I can use the help of the local Hams to help me test and tune. Can anyone recommend kits that will work well in my application?

Thanks in advance for any help,
Larry Rubanka

2382. Can Flexnet be used as "dumb" modem?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-24 00:00:00 UTC
From: Larry Rubanka <lrubanka@execpc.remove.this.part.com>
Message-ID: <6kaf18$9dn@newsops.execpc.com>
Source record: 23960

I'm wondering if I can use Flexnet to recieve simple modem transmissions?

I'm hoping to transmit telemetry data from a flight computer to a ground station. The flight computer will be equipped with a modem and transmitter. The transmissions will be simple serial data streams.

Could I use Flexnet to save a buck on the ground setup? That'll let me spend more on the flight gear.

Thanks in advance,
Larry Rubanka

Using DspGold with my AEA DSP2232 Multi-Mode. I deleted the text files and readme files after installing gold, needed the HD room. Needless to say bad move because my hard drive puked and I can't find my install disk. I've got my windows backup disc to reinstall gold from but don't have the text files because I zapped them BEFORE the backup. Another stupid move! I'm not sure if there's any helpful info in them or not but would like to have them nonetheless, just in case. Now I've got tons of HD space so once their back on they can stay on :) If anyone out there has DspGold from Interflex and can e-mail the text and readme files it would be very much appreciated. TIA

Neither do the first, third, fourth. . .amendments.

In the first amendment, the right of the "people" to peacabley assemble applies to individuals and limits the power of any level of government. If the "people" are a collective such as the state, no one can assemble unless they are members of the national guard or other state sanctioned function.

Also, in the fourth amendment, the right of the "people" to be secure from unreasonable searches and seizures is an assertion of individual rights and a limit of all levels of government. Same for the other amendments comprising the bill of rights.

In the second amendment, the right of the "people" to keep and bear arms are an exception???? a collective right??? Think!

A state cannot have a RIGHT. States only have AUTHORITY granted to them by consent of the PEOPLE who have RIGHTs.

Read the federalist papers. They explain it all.

I was talking to a couple running a booth at Dayton. They are
from Oregon and sell bags and other goods (like holsters) at
hamfests and gun shows. They were so used to west coast hams
that are very liberal and very anti gun.

They were very surprised that midwest hams are conservative and
usually carry guns. I would guess that the third of the folks
at Dayton had a weapon on them. My guess is that different types
of folks get into amateur radio depending on the area. Midwest
liberals just are not interested in technology.

2389. When Hams use Guns

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-25 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <6kbglk$ou4@enews2.newsguy.com>
Source record: 23967

I have had three occasions to use a firearm in connection with amateur radio activities.

The first instance was at my parent's farm, where a pine tree had grown to where it's top was brushing the tower's guy wires and eventually would cause problems. For this application, a .22 rifle with a full clip or two of ammo served well to top that pesky pine tree. - I just kept shooting at the trunk, about four feet down from the top. The wind did the rest.

The second time was during a get-together of the local hams in south Texas. We were having a BBQ for all of those guys, and things looked pretty grim because my grill was not ventilated properly and would not get hot enough to cook the fajitas.
Taking the food off of the grill, a half-dozen rounds from my .45 auto provided the needed ventilation, saving the day. After that, the grill behaved perfectly.

The third occasion was when I needed a small hole drilled through 1/4" steel for a project. Since I had loaned out my drill motor, I thought I was out of luck until I remembered my .300 Winchester magnum rifle. Sure enough, a 180 grain pill moving at close to 3000 fps drills right through 1/4 inch steel. It made a nice clean hole which was just right for the job.

The .22 long rifle, the venerable .45 auto, the powerful .300 Win magnum - These are all tools which, when used properly, can greatly enhance the amateur radio experience. The key to the use of these is safe, responsible handling. It important to always use the right tool for the job, so my advice is that each ham keep a variety of firearms on hand at all times.

Cars deaths are accidental. I don't remember hearing of a kid steering a car into a crowd of students. You have no point. Shooting someone with intent to kill is not an accident. Kids grow up with a fasination of guns. TV, the news, and gun lovin' parents are likely at fault. The NRA say's that education is the key. Gosh I think these kids already know how to shoot.

Enough said, our society has no real use for guns regardless what you say. They kill, thats what they were made to do and thats what they're being used for.

Gary

I'll second Kevin's idea. Even though I can't believe that this type of
tragedy would happen, I wouldn't wish it on anybody...not even Butt...I
mean Burt. My best friend was shot and killed in a drive-by shooting two
years ago. I will NEVER forget the moment when I was told what had
happened. Maybe this isn't the right place to talk about this, but maybe
Butt...I mean Burt, should get a life, and realize that this COULD actually
happen to him. What would he say then?? Would he still ridicule the
world??? I'm not saying I'd want it to happen to him, but maybe he needs
to clean the pre-mordial ooze out of his eyes and his one brain cell and
take a look @ the world.

No.

Did New York's DECADES OLD gun control laws some how finally, magically take effect in the last few years?

No.

Does Oracle ever actually think about his arguments before spooging them all over the net?

No.

Once again the media (and other foolish types) blame an object for a crime rather than the PERSON who committed it. If the courts in this country would lock up (permanently) or execute all violent criminals the FIRST time they commit a violent crime then maybe teenagers these days would see that crime doesn't pay. And maybe parents these days should expect some responsibility from their children at a younger age instead of letting them run around like wild animals. By the time I was 13 I knew darn well what was right and what was wrong and that my parents would hold me fully responsible for my actions. Today many kids have nothing expected from them until they meet the real world and by then it is too late.

A good overview of the choices for digitally implemented radio is found
in
IEEE TRANS. CIRCUITS & SYSTEMS II, MARCH '98 VOL45-3 "Low-IF Topologies
for High Performance Analog Front-Ends of Fully Integrated Receivers",
J.Crols & M.S.J.Steyaert pp269-282.

From my own experience zero-IF is mostly OK unless you want SSB modes or
very high performance. The DC drift problems can be very annoying for
SSB (they appear as a tone). I-Q match is also a real problem for ZIF
archetectures. I would always implement a low-IF strategy and mix to ZIF
digitally.

Eric

You didn't mention if you are a licensed amateur radio operator. This is
key, but let's assume that you are...

>Band: I think I should work in the 70cm band. Does this make sense?

It would be interesting to estimate the doppler shift you will experience
when transmitting from a quickly moving rocket. You'd have to make sure that
your shifting frequencies down't spill over into other bands. To be safe, if
I were you, I'd choose a less popular (i.e. crowded) band. Try something
higher up in UHF or SHF where activity if low.

I'm also just curious ... how and where do you shoot these rockets so they
don't collide with aircraft?

What kind of data are you sensing and broadcasting on the downlink?

>transmit only (for now). Should I look for transmit only gear?

Transmit-only sounds like it makes sense for lighter weight. Check Part 97
of the FCC rules to make sure you are within the guidelines ...
but I remember the first OSCAR satelite was telemetry only
(no receive as far I as I remember).

But you'd have to include a CW id or something to respect the rules.

>
You know, of course, that each character in the 7 bit code has a constant 4
marks to 3 space ratio. This eliminates many errors. In the event that both
the original and the repeat character pass this check but are still different,
you have no way of knowing what the character was supposed to be, so an error
character is printed. An error is also printed when neither agree and neither
pass the parity check. Typically an asterisk is used. The human operator at
the recieving end can usually fill in the gaaps from the context.

A good reference for you would be "Rec 476-3" from the Proceedingss of the
third ARRL Amateur Radio Computer Networking Conference, available from ARRL
HQ. This document contains most of the technical specifications of the AMTOR
modes, and AMTOR FEC is identical to SITOR mode B which is of course the mode
used by NAVTEX.

2403. wa4dsy modem and transverters

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-26 00:00:00 UTC
From: qwasty@hotmail.com
Message-ID: <6ket8n$7e3$1@nnrp1.dejanews.com>
Source record: 23885

(I think I'll congratulate myself) I broke-down and ordered a wa4dsy modem and a packetwin card from www.paccomm.com, I'm still waiting for them in the mail. I was looking at www.downeastmicrowave.com and their transverters, does anyone know whether the 432-28 transverter will work well with it? is it full duplex?

2404. KA9QNOS and Windows 95?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-26 00:00:00 UTC
From: Kai Boulton <kai.b@cableinet.co.uk>
Message-ID: <356AF157.24213113@cableinet.co.uk>
Source record: 23886

Hi There,
I wonder if you can help.

I want to get the KA9QNOS Derivative, UKNOS running in windows 95 using
either my USCC card or a baycom serial modem..

How do I go about it?

What drivers are there for uscc/baycom that will run in windows 95?

How do I configure the slip/ppp links so I can use std internet programs
for mail/news?

Any help is greatly appreciated...

Thankyou..

Wrong. When the police decided to enforce them rigorously, violent
incidents in the enforcement area decreased.

Our "RIGHTS" come from God and given by him to "The People" in the USA
who in turn "loan" to our government what is needed to manage our
nation. In European and Socialist countries they believe that the
"rights" (power) comes from God and go to the King (or government) who
then loans those rights to the people (their subjects). This concept
is what makes the USA so unique.

They sought out the people most likely to commit homicides
with a gun, and those people were NOT ordinary gun owners. They
were gang bangers, people who brawled while drunk, and people
who harrassed strangers on the streets.

Sorry, wrong answer. Mayor Guliani took a page from Boston's book,
drastically increased the numbers of police on the street, and began
strictly enforcing ALL laws, including "quality of life" laws such as
jaywalking. There was no special attention or enforcement for firearms
laws any more than other laws. Strangely enough, more police better
enforcing all the laws led to lower crime.

Tell me, oracle, why are you sending this to all these radio groups?

: Sorry, wrong answer. Mayor Guliani took a page from Boston's book,
: drastically increased the numbers of police on the street, and began
: strictly enforcing ALL laws, including "quality of life" laws such as
: jaywalking. There was no special attention or enforcement for firearms
: laws any more than other laws. Strangely enough, more police better
: enforcing all the laws led to lower crime.

Wrong. The program was born in an analysis of violent crime. The drastic
action necessary to stop the observed crime was covered by what appears to
be enforcement of quality of life laws because it could be, and is, seen
by some as harassment.

: Tell me, oracle, why are you sending this to all these radio groups?

I never edit the headers. A newsgroup in the header when I begin my
response will be there when I finish it.

Wonder if they did it the way Atlanta is accused of doing it -
simply reporting a serious violent felony as a misdemeanor.

Ya know, what amazes me most about this is that there are 103 messages in this thread and I don't think ANY of them have to do with rec.amateur.whatever in the least. Why not take this whole discussion over to another news group so they can be bombarded by this drivel. This thread is just like every one that talks about code vs no-code. Everybody has opinions but, at least they are related to the group topic.

GIVE IT A REST!!!

That or someone please write a small program so that my server doesn't have to waste time sorting thru items like this. While you're at it, how about being able to filter out certain users that start threads like this... They know who they are and I am NOT pointing this at the originator of this particular part of the thread... I've just had ENOUGH!!

If we spent this much effort in writing to senators and congressmen, maybe we wouldn't be losing the 440mhz frequencies to outside interests...

There, that's all I have to say about this subject. Sorry to take up your time...

Date: 1998-05-26 00:00:00 UTC
From: David Skillings <brisa@ihug.co.nz>
Message-ID: <6kclq8nbb1@newsource.ihug.co.nz>
Source record: 23975

Hello.

Some fellow cruisers here in Whangarei, New Zealand have just added a Kam+ for packet & aprs communications. However, if the cable going from the ICOM's Acc plug to the Kam+ is left in place (Kam powered off or disconnected) they are not able to transmit voice using the microphone.

If the cable is disconnected then everything works just fine.

Any help would be appreciated.

From: "L.Mol" <L.Mol@stm.tudelft.nl>
Message-ID: <356A7398.6E5D3BE3@stm.tudelft.nl>
Source record: 23977

Hi there,

I'm busy with a little project: building my own stand-alone navtex reciever. What i do know is: 518 kHz, FSK, shift = 170 Hz.
Further i know hoe to interpret the characters which are recieved (the structure of the navtex message)
Also i know it's transmitted using Forward Error Correction .... Amtor Fec, which is also called Sitor-B. I understand each character is beeing sent twice, with a delay of 350 ms (which is 5 chars or 35bit at 100 baud)

Am I right the stream of chars then looks like this:

A1 x2 B1 x2 C1 A2 D1 B2 E1 C2 F1 D2 G1 E2 H1 .... etc.

But what's the point in that? Ok, if you recieve the same A1 and A2 you know pretty sure what A was meant to be. But what if not? How to decide what char to print then?

In other words: How does the amtor fec protocol work, what are the specs?

Thanks for any help !

Lukas Mol

2418. Re: Need help on amtor fec (=sitor b)

Newsgroup: rec.radio.amateur.digital.misc

From: Bob Lewis <aa4pb@erols.com>
Message-ID: <356AA2BD.E1BF72AF@erols.com>
Source record: 23978

The reason for spacing the like characters is that a noise burst may wipe out one of the characters but hopfully not both. The biggest problem I seem to have with FEC is loss of syncronization. Sync characters are often only sent at the end of a line which means if you get a noise burst and loose sync at the beginning of a line you loose the whole line.

2419. 1200 kbps packet: TigerTronic vs. BayCom ???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-27 00:00:00 UTC
From: chris@spd.analog.com
Message-ID: <6kfukn$lkh@nwd2nws1.analog.com>
Source record: 23897

Hi, I am looking for your advice and experience and
recommendations. I am trying to choose between the
BayCom Micro Modem (fits within a 9-pin RS-232 connector)
see: http://www.baycom.de/cat/index.htm
and the Tigertronic Model BP-2 Packet Modem "BayPac"
see http://www.tigertronics.com/ (server currently down).

Firstly, it is confusing because BayPac is a name close
to BayCom, but apparently they are not related.

Tigertronics claim their unit is "BayCom-compatible"
whatever that means. Perhaps that they use the same
PC terminal software?

I tried to call Tigertronics on the phone, but their
tech support line is only open part days, 3 days a week,
and they don't accept techn questions via email or FAX(!).

Neither one sells the product off-the-shelf ... all orders
are pre-paid by mail order only, so I can't browse them in
a store.

=-=-=-=-=-=-=> Note that I am specifically looking for
a very small packet modem without external AC or battery
power so I can use this while I travel lightly. I have a
Yaesu FT-50RD which cannot support 9600kbps anyhow, so
I'll have to make do with 1200kbps.

Please reply best via email to: chris.cavigioli@analog.com
Do NOT use the "from:" address above to reply to.
I don't read usenet news often, so email reply is better for me.

Thanks and 73s,
Chris Cavigioli - WB1FBZ (currently living in Munich, Germany).

>You didn't mention if you are a licensed amateur radio operator.
I'm testing for technician+ next week.

>It would be interesting to estimate the doppler shift you will experience
>when transmitting from a quickly moving rocket.
My flight computers are equipped with accelerometers and barometers. They measure acceleration and air pressure, I deduce velocity and altitude from this data. Measuring Doppler shift would be nice, but I'm not ready for that yet.

>To be safe, if I were you, I'd choose a less popular (i.e. crowded) band.
>Try something higher up in UHF or SHF where activity if low.
33 or 23cm; maybe higher? How available is gear in these frequency ranges?
I've been looking at off-the-shelf 70cm data radios for $150-300US.

I was thinking low power (350Mw . . . less?). I'm only 2 miles away from the transmitter, and it's all line of sight, straight up (usually).

>I'm also just curious ... how and where do you shoot these rockets so they
>don't collide with aircraft?
I fly under an FAA waiver at the Bong Recreation Area in southeasern Wisconsin, USA. This is a retired air force base with loads of open space. Our organization, the Tripoli Rocketry Association, has an FAA waiver to 10,000ft above ground level. Aircraft must fly around us.

>What kind of data are you sensing and broadcasting on the downlink?
The flight computer takes in analog signals from the transducers (acceleration and air pressure) and digitizes them. The data is stored in onboard memory and sent out from the computer in a serial (rs232) data stream. In my case to a modem and radio.

>But you'd have to include a CW id or something to respect the rules.
Aalready wrote the code for this part. I originally planned on using a tiny home brew 2m locator transmitter. The computer just makes and breaks the power supply to the transmitter.

The bottom line is that this is just a tiny little computer/radio setup. Almost the same thing as packet radio, but no "networking" protocols.

I'm interested in trying ATV after I get the telemetry system down and would like to choose a transmitter capable of handling that kind of bandwidth.

What should I buy?

Thanks for your response. I look forward to your feedback.

Larry Rubanka

P.S. It looks like you work for Analog Devices. I use your accelerometer chips. Good stuff!

You may want to look at the MIM board that some APRS guys are using for trackers. It is set up to do telemetry and uses the AX.25 protocol. It has 5 analog inputs, and eight digital ones, it also accepts GPS data. Your ground station would be a basic packet station running APRS.

Doppler would still be a problem, but perhaps you could get around that by having your ground station receiver scan multiple frequencies within the expected shift range.

Tigertronics is a dealer for the Baycom software and sells their own version of the modem hardware, which is why they created a different name. The concept and basic design were done by the Baycom group in Germany. I believe that PacComm also sells a similar unit. The schematic is readily available, perhaps on the baycom web site, if you want to build your own. The software is proprietary.

PacComm and TASCO have some other very small units which are "real" TNCs and are compatible with more software. I think a couple of the TASCO units will run with internal batteries. The Baycom modems are powered from the voltages on the p.c.'s serial port. This doesn't always work with laptops, however.

You can check out PacComm at www.paccomm.com. I don't have information on TASCO. They don't market their products in the U.S., but may be available

in Germany. They have a web page at www.tasco.co.jp, but it is in Japanese.

Doppler shift will be zero at or just beyond the peak of the trajectory,
depending on how nerly vertical the flight path. If you are willing to settle
for a fairly small window for reliable reception, the moment when the distance
between transmitter and reciever is unchanging is your window.

An interesting technical excercise would be a reciever that automatically
tracks frequency of a carrier and maintains a lock between LO and the
transmitter. This would be quite a challenge at the speeds involved.

Doppler shift will be greatest at a point directly in line with the flight path
of the rocket, i.e. right at the launch site, since the vector quality defined
by the motion of the rocket away from the observer/receiver at the launch site,
which directly determines shift, will be equal to the actual speed of the
rocket, and so at it's maximum value. A simple way to minimize the doppler
shift would be to locate the reciever some distance away from the flight path
and perpendicular to it. The further away, the less change per unit of time in
the distance between transmitter and reciever... in other words, the slower the
speed that the transmitter travels away from the receiver. A repeater set up
about 10 miles away, or possibly further with good height and with gain
antennas, could retransmit the data back to the launch site for "instant
gratification". Wide shift would also make reception easier.

I answered my oen question (see I'm learning).

I'll use a tnc in the rocket and program the flight computer to emit a "connect" command, then stream the data through a conversation (terminal) session.

I'm afraid you'll have a problem doing that. The TNC on the rocket
(unles it has a receiver) will never start sending because it never gets
a connect acknowledgment from the other end. You'd probably be better
off to use "UI" frames by sending a "k" command to the rocket TNC and
then just start streaming data. On the ground end, turn the "Monitor" on
on the TNC and run a simple terminal program (Windows "term" or
"Hyperterm" or any of thousands of DOS modem programs) and set up
capture to a file. If you want to be sure you don't miss any packets,
have the rocket computer duplicate transmissions (send each line 2 or 3
times) and sort it out later from the file.
If you want to save weight and cost, just use a simple modem (Baypac for
instance) and send plain ascii data and capture with another modem. (The
FCC says ascii is just fine.) If error checking is important to you, add
a simple protocol to the computer to generate a checksum and use resends
as above. I've done quite a bit of this sort of thing in industrial
systems (no rocket experience though) and would be happy to help.

Maybe. Maybe not. That's not the point. The rate of violent
incidents decreased when they got the guns off the street.
According to the gun cult that shouldn't have happened because
"people kill people." Merely removing the guns and leaving the
violent individual would have had no effect on violence.

There is no doubt that he would have killed them any way this NICE
LITTLE BOY was found to have at least 3 bombs that were made out of
common household items that are in almost every house. But we can
eliminate this problem by banning or at least registering and having a
waiting period on these every day items or maybe ban ar register the
knowledge. What do you think? Ban or register every chemistry book and

teacher in this country and make sure we include an import ban on all common household material that could be combined in some manner to create a bomb. How does this sound?

Hi,
We are starting to stir up interest in Hellschreiber here in New Zealand.
There are three known ZLs who are able to operate. Look for us
around 2000z on 3558 kHz or thereabouts most nights.
If you are operational on this fascinating mode, please join in and
preferably email me as well, so we know where and when to look. I am keen to
work trans-Tasman. Also looking for weekend daytime contacts on 40m and 30m.

If you have no idea what I'm talking about, check an old ham Radio Magazine
(Dec 1979), or check the web site
http://www.nvg.ntnu.no/~engini/hr_dec79.html which has a reprint.

Software for operating Hellschreiber with a Hamcomm or JVFAX interface is
available on the web at either of:
ftp:sartg.intron.se/pub/sartg
http://www.nvg.ntnu.no/~engini/ck_hell.html.

There is other stuff available at:
http://www.netup.no/~clank/hell/hr_la0bx.html
http://home.c2i.net/clank/ham/hell/hell.html

This is an old but still modern digital mode, very noise immune, and ideally
suited to QRP operation on noisy bands. We get 5x9 copy over 1500km under
the noisiest of conditions. See you there!

73,
Murray ZL1BPU as149@detroit.freenet.org

Racal RA1792 Receiver

£780 o.n.o

150Khz to 30Mhz Coverage, 1Hz steps with list search
AM/FM/CW/USB/LSB
Filters fitted
0.3KHz 1KHz, 3.0KHz, 6.0KHz, 16KHz and 2.7Khz USB/LSB
SCORE board fitted and working!
Internal A8 frequency standard fitted.
For the technical amongst you the precise model is a GB/S/1/0/S/1/A s/n 8797
except that the 3.2KHz usb/lsb filters have been replaced with 2.7KHz
filters. I have in stock a number of other narrower filters if anybody is
interested.

Drawing Number is ST 80730

New Liquid Crystal Display Panels have been fitted so no 'going black'
problems.
New on-board Ni-Cad battery fitted so no nasty leaking battery acid on the
processor board.

This receiver has been fully tested and aligned by an ex. Racal Radio
Engineer (me!!) and is in very good condition. Sensitivity is better than
spec. and I have a full history including full build state information.

Contact me by e-mail mike@gibsonmb.demon.co.uk or phone me on 01494816342

>Can anyone here offer any help on getting this going??
Yes..
You have to use BPQ ODIDRV.COM.. You'll find it in the same katalog
as the rest of BPQ software. I'll using Ethernet BPQ to forwawd form
Packet BBS to DXCluster.. It's very fast :)... If you like i'll can
send you some more info, but i dont have it here i'am now.. Okay??
But if you carefully read BPQ DOC files you'll will at last find it
out :)...

If you quote Professor Lott, The violent crime rate drop when the
average citizen has the right to carry a loaded firearm.He has graphs to
prove it. Even HCI reports claim 29,000 times private citizens stopped
violent crimes by the lawful use of firearms, so even that group says
legal gun ownership reduced crime.Is working here in Phoenix,Az.

>28.3 to 28.5 N and Tech CW and SSB

Correct. Data transmission on 10m is limited to the 28.0 to 28.3 MHz
segment (28.1 to 28.3 MHz for Tech Plus and Novice).

>No restrictions on baud rate station must ID PHONE or CW every 10 min as
>allways.

Incorrect on both counts.

The baud on 10m is limited to a maximum of 1200 by 97.307(f)(4) (note that baud
does not necessarily equal bits per second, symbol overloading is permissible,
though it is not common amateur practice). Shift must not exceed 1 kHz.

While IDs may be done in Morse (no faster than 20 WPM), it is permissible
to ID in the digital code alphabet being used instead, 97.119(b)(3), and this
is normal US amateur practice. In other words, we *do not* ID in Morse or
via voice in normal US digital operation. (Voice is illegal in the digital segments
of HF anyway, and speed limited Morse wastes channel capacity.)

>higher up in UHF or SHF where activity if low.

Doppler shift increases with increasing frequency, so going to a higher band
will make doppler problems much worse. But doppler shouldn't be that much
of a problemon 70 cm. Satellites move much faster, and the doppler from them
is manageable on 70cm. Doppler shift is something like 0.3 Hz/MPH on 70 cm,
so even if the rocket reaches a couple thousand MPH, shift will still be well
within FM capture parameters.

Their 432 Xverter also works with the DSY modem, but you need to make
a capacitor change in the TR circuit to speed it up (already done in the
222 MHz model) for half duplex operation.

It is possible to do in-band duplex, but of course you need a repeater
type duplexer and a separate receive converter *at each end*. It is easier
to do crossband duplex because you can use a simple (cheap) diplexer
instead (you still need the separate receive converter, of course). Don't
forget that your partner has to be setup opposite of you, IE his transmit
is on the band of your receive and vice versa.

About a year ago I purchased an serial adapter from a website and cannot find that site again. I lost/misplaced the instructions for connection of the four wires to the rig. If the owner of the site should see this or any one that may have purchased one also, please get in touch with me butchkay@netdoor.com

The serial adapter has 25 pin male with din plug at other end and a din plug plugs into that and it has standard phone cord from there to rig, black, red, yellow and green. I must have tossed the instructions and hope one of you guys can help me out.

tnx, Butch KF5DE

Precisely how many guns did they get off the street? How do
you KNOW this figure? You can't!

The only real gun "program" was an attempt to catch people
who bought guns in one state and sold them in New York. There
is no way to assess how effective this single step was.

Guiliani had a comprehensive program and people like you are
ascribing the entire positive result to something you can't even
put a number on. You can't use univariate statistics to prove your
point. You have to do something akin to what John Lott did.

Your four wires are Ground, TX Audio, RX Audio, and PTT. First thing first....
find PTT. When the program is in TRANSMIT mode, you should see 0 resistance
between PTT and GND. When the program is in RECIEVE or STANDBY, you will see
an open circuit. Assume green to be GND and look forr the other wire that must
be PTT.

Two down, two to go. Figure out which is the RX AUDIO. To do this, make up a
pigtail on a phone plug the size that the phone jack on your rig uses. With the
program in RECEIVE mode, or better yet TUNE or SCOPE if your program has
anyting like that, look for an indication that your computer is seeing your
receiver's audio. Sweep across some CW or RTTY signals. It should register
something when an audio tone sweeps through the range 1500 to 2300 Hz. Make
sure GND is connected.

The TX AUDIO is the one left over. Just to be sure, hook up an audio amp and a
speaker or phones to it,, and make sure your GND is hooked up. In TX mode,
assuming your program has a picture in the TX buffer you should hear the
modulating audio.

NOW... get yourself a mic plug that fits your rig. Refer to the manual... hook
up TX AUDIO, GND, and PTT to the proper pins. You may have a pin at the mic
connector where you can get RX AUDIO as well... use that and you can still tune
by ear listening to your rig's speaker without messing with a "Y" adapter. It
may be called RXD or RX DATA in your manual.

Before you transmit, you may need to set the TX audio level. Look for a tiny
pot accessible via a hole in the case. If there isn't one, You will have to
adjust the mic gain on your rig. You mustn't overmodulate or you will cause
interference on the band and possibly your signal will be hard to copy at the
other end. If you don't have any kind of scope, just increase the drive to
"just barely" maximum reading on your power meter while transmitting into a
dummy load or on an unused frequency. back it off to about 80%, and you should
be okay for now.

One good reason to build rather than to buy one of these simple appliances is that you may need to build an attenuator pad anyway, and you may want audio filtering for both TX and RX, as well as an opto-isolator in both lines. By the time you get done building that stuff, your matchbox size dongle is overwhelmed by another outboard unit connected to it. May as well have it all on one board.

Your unit will probably work with several other programs for SSTV, FAX, RTTY, AMTOR/SITOR, and CW. There are a lot of programs for thhose modes that utilize the comparator type interface, notably HAMCOMM and JVFAX.

If you have a Pentium based machine, don't be surprised of performance is less than spectacular. You may get better results with a 486 or a fast 386. I have heard disabling cache-ing helps on some pentiums, but I sill get lackluster results with my Toshiba notebook, though it worked FB on my old 486 T-1900.

Hello All,
I would be glad if anyone out there could tell me all the different kinds of Digital Radio Modes.(RTTY,WEFAX,PACTOR,SSTV,AX25 and etc.)
I would also be glad if you could explain to me the uses of each different Digital Radio Mode. Please also recommend me a good TNC that perhaps could cover all different Digital Radio Modes and support colour in SSTV.

Thank You very much in advance,

check if I understand this: so, if I want to go cheap, and make it easier to connect to someone, then it would be better to go half-duplex(and sacrifice thru-put) with their ready to use 432-28 transverter only. I will be able to work in-band with anyone with a similar setup. I presume it does not matter whether the xverter does split operation or not since it will be half-duplex.

correct?

>
>Then one must wonder why you would choose to repost the entire ad,
>even including the sig :-(
>
>BTW, as you claim to have a copy of the charter for this newsgroup,
>would you please post it or email it to me.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment,
.homebrew,
and .space are for more specialized areas of ham radio: discussions
about
antennas, the older tube based amateur, military, and commercial gear,
commercially-made equipment, homebrewing, and amateur radio space
operations.
The .equipment group is not the place for buying or selling equipment;

that's
what rec.radio.swap is for

^^^^^^^^^^^^^^^^^^^^^^^^^
. Similarly, the .space group is specifically
about amateur radio in space, such as the OSCAR program and SAREX, the
Shuttle
Amateur Radio EXperiment; other groups cover other aspects of satellites
and
space. Homebrewing isn't about making your own alcoholic beverages at
home
(that's rec.crafts.brewing), but rather construction of radio and
electronic
equipment by the amateur experimenter. The .dx group is devoted to long
distance amateur communications.

Taken from the "Guide to the Rec.radio Newsgroups".

I would like to know what the speed of the Earth has to do with 1200 baud packet on 10 meters. Maybe I am dumb but don't see the connection. I remember using 1200 baud on 10 meters during the last sun spot cycle and it worked very well. Has local stations that ran a gateway from 2 meters to 10 meters and they used 10 meters for almost daily skeds while the sun spot cycle was up.

While many amateur radio conversations have very little contents, it
is a bit harsh to say that 99.9 % of it is redundant :-), or how else
are you going to get the 1000:1 compression ratio required (or more
realistically with current links something like 10000:1 would be
required).

Hi there,

anyone know of any amateur work on using the 802.11 wireless LAN for packet radio or using the ETSI HiperLAN (upto 20Mbps!)

They would enable a really good AMPRnet to be built. Any ideas?

Suggestions, comments welcome (newsgroup or email)

2488. FS / Trade - Notebook Terminals

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-30 00:00:00 UTC
From: dusty - K4NLZ <kaliber@pacbell.net>
Message-ID: <35705D23.70F78188@pacbell.net>
Source record: 23866
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.swap

For sale or trade , 2 ea. Data General "walkabout" portable notebook terminals. Each unit runs on internal battery pack (conventional 5 aa nicad pack)
or wall wart. (9 volt) and has lithium cell memory back-up. Small units that
look like notebook computers but have no disk drives or hard drives. They
can do built-in simple word processing, emulate several terminals, and have communications programs that work thru the serial port or internal

2400 baud modem. The serial port speed is up to 19200 max. Each has a large 9" X 4" LCD display and large notebook 'computer like' keyboard. The batteries in each unit are old and should be replaced. They are accessed
via a convenient top mounted slide off cover, and are standard conventional aa
nicad packs. There is only one wall wart but use standard Radio Shack 9v
adapters, or 9v automotive cigarette lighter adapters.
These small portable units would be excellent for mobile or portable (field day)
operation of packet modems and tncs. There are also many other excellent
uses for these such as pic/stamp apps and robotics controllers and user interfaces.
Digital mode operations with a KAM ot MFJ tnc , portable or mobile would be
xlnt due to their small size. Closed they measure 12" x 11" x 1 3/4" . They have
9v ext. power connectors, serial ports, parallel ports and rj-11 telco modem
connections. Of course they could be used , thru the serial port, with much faster
modems.
I am asking $30.00 each (there are 2 of them) and $5.00 for the wall wart.
(you probably already have a 9v wart laying around) , shipping is extra.
If you are interested in these cool little portable terminals contact me
via e-mail or via info at QRZ database.

Thanks in advance
dusty

Well, I thought I might have judged Burt wrong with my quick reply. I thought to myself "Well, just read what he has to say. Maybe I might have been wrong. Maybe he actually has something productive to say about amateur radio. Maybe he actually might be a decent guy. " NAAAAAA! Again stated...WHO CARES?!

Matt...(and Burt for that matter)...I frankly get tired of Burts cross-posted trolling BS (might I remind you about the recent hams and guns cross-posted "series" that had absolutely nothing to do with the NG's that it was posted on.) Yea, you can say I'm having my fun...browsing these great newsgroups(don't you enjoy it?). I enjoy reading ham related postings and articles. I don't like being subjected to spam, stupidity, and Burt's trollings. Don't get me wrong, Burt has the absolute right to say anything he wants. BUT, I also have the same right to say what I feel also. Matt, it's not the power...it's the "right"...a God-given right and guaranteed by the Bill of Rights. I assume the UK has something simular. There is an old saying..."your right to double up your fist ends at the tip of my nose". I know I am not the only person that has been offended by Burt's crap. As a ham...if you enjoy being slammed by Burt...more power to ya. Me...I'm going to speak out when I get slammed.

2492. Help with Icom 706mkII & SCS & AIRMAIL

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-30 00:00:00 UTC
From: Mitch Hart <komfy@ibm.net>
Message-ID: <3570E23F.F55AF3DD@ibm.net>
Source record: 23870

Hello anyone...,

I recently purchased an Icom 706 MkII(appears a great rig, but "extended" reception on marine VHF is pretty crummy...) and a second hand SCS modem (Pactor II capable, version 2.3 upgrade). The Icom will talk fine with my Kam plus (as did my Kenwood TS440), but the AIRMAIL program on the SCS unit just chokes. Airmail is a relatively new piece of software (perfect for marine mobile...), that can address KAM+ and SCS modems (and I think AEA's).

With the KAM+, all is fine. However, with the SCS (after changing the required settings) I get the error " Access violation at address 00464F7F in "Airmail.exe". Read of address FFFFFFFF." There is also an error log, which indicates the message "Faxcomm:error reported to input:2". Using Win Explorer to find a file that starts with FAXCOMM*.* was negative...

While I know it is almost impossible to troubleshoot an exe file, the symptoms may be a little more common. I hope that someone upgrading from the KAM+ to the SCS may have seen something similar??? I am running win95, and a pcmcia card modem on COM2, (the SCS serial port is COM 1), on a Toshiba laptop. I have checked for port conflicts, but nothing else is assigned to Com1. I have removed the modem card, same results (after rebooting, of course). I have used F8 to boot up in safe mode-that leaves me without functioning com ports (big help...). Anyone have any ideas???

Meteor scatter links on 2m are extremely short-lived! However, that
doesn't stop amateurs using them.

I think it depends on how you regard packet - If you think of it just as
a mode for trying to build networks, then 10m packet is probably not of
much use, at least not on ionospheric paths. If you regard packet as an
amateur radio mode which has uses beyond networking, then 10m packet can
be quite interesting.

Here in Europe the centre of 1200 baud packet activity on 10m is
29.250MHz. Es openings during the summer show that there are a
reasonable number of stations active. Paths usually don't stay open for
long, but that's part of the fun!

2495. BPQ, TST and some problems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-31 00:00:00 UTC
From: ruga@ita.flashnet.it
Message-ID: <35713c44.7908140@news.flashnet.it>
Source record: 23730

Hi everybody...and thanks for reading this message.
I have installed a node using bpq 4.08 over tsthost 1.42 and 1 (soon 2) baycom ports at home of a friend of mine.
I use a similar configuration on my BBS (ita490), the difference is that I run BPQ + FBB5.15c instead of tsthost.
But come to the problems.
There is something I could not undertstand:
1) When I connect the node with the call ITA490-1 and then try to connect my BBS at the call ITA490 or ITA490-8 the node it3gio-2 connect at the beginning ITA490 (or ita490-8) with my call changed to ita490-14 but after some packets the node gives the DM- and then the connection failes.
If I use a different call from ITA490-1 all works ok(i can't change only the ssid, i must change the call)...but if the call connecting the node (and then my BBS) is the same as my bbs but only with the ssid changed, the connection is impossible...is like as the bpq doesn't recognize calls different only for the ssid

2) If I use tst + BPQDED + BPQ there are a lot of problem concerning the calls. If in tst my friend change his call to, for example it3ABC and then connect the switch, when he try to connect someone is call is still it3gio-2 or it3gio-8 (depending of which ports of tst he uses) and h can't change it...Another problem is that only 1 port (instead of 8) of tsthost is available, and when the call of BBS (it3gio-8) is in use, no one could connect the BBS.

I use BPQ with FBB5.15c and MFJ1278 and I don't have this problems...someone could help me!?!?!?
Many thanks in advance...I hope you could solve this matter...
Many many thanks...

Even if I do own one, it is no one's business, and I too am a Ham
Operator. Do I or don't I? The burglar or anyone else uninvited, who
enters my home will get the real answer if and when that should happen.
Guns and Ham Radio have nothing in common, so why thread such a ridiculous
subject in a RADIO related News Group?

It probably has something to do with the ionosphere (which changes
during the night hours, i.e., when the sun is down :-) You know
those F layer, E layer thing-a-ma-jigs...

Come on, I'm trying not to get too technical, but if you want I can
type in the whole textbook with pictures and everything...

I just thought it was a question that was best answered: "read the book!"

I think all the BBS's will be dead by the time the band opens (hopefully).

2501. T1 digital, is anyone doing it, or is everyone playing with toys?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-31 00:00:00 UTC
From: jbryant@tfs.net
Message-ID: <3571adc1.0@news2.tfs.net>

Cross-posted to: alt.ham-radio.packet,alt.radio.digital,aus.radio.amateur.digital,rec.radio.amateur.digital,rec.radio.amateur.digital.misc,rec.ham-radio.packet,uk.radio.amateur

I'm tired of playing with these toy tnc's.

I have recently obtained a T1 DSU/CSU, and am looking for like minded people who are also tired of playing with toys.

Is there anyone out there with experience doing T1 data on 5, 10, or 24 GHz? I could use a few pointers. I am wanting to focus on these bands, because antenna gain is high for a small dish [18-24"], and it could be operated portable.

Please answer this only if you are serious.

If we are to take amateur radio into the next millenium, we really have got to get rid of the toys, and move into some real data experimentation.

jim

2502. 1998 ARRL and TAPR Digital Communications Conference

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-31 00:00:00 UTC

1998 ARRL and TAPR Digital Communications Conference
September 25-27, 1998
Chicago, Illinois (minutes from O'Hare Airport)

Web: http://www.tapr.org/dcc

It's that time again! Mark your calendar and think about what to publish for the upcoming 17th Annual ARRL and TAPR Digital Communications Conference. This is the third year in which the ARRL Digital Communications Conference and TAPR Annual General Meeting are joined into one conference!

The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies, who meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital expert, but for digitally-oriented amateurs at all levels of expertise.

The 1998 ARRL and TAPR Digital Communications Conference will be held September 25-27, 1998, in Chicago, Illinois. This year's conference location is the Holiday Inn Rolling Meadows, just minutes from O'Hare Airport.

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes APRS operators, digital networks, software writers, modem designers, and digital satellite enthusiasts. The ARRL and TAPR Digital Communications Conference is for all levels of digital operators -- a must conference to attend to become active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds because it is important that we demonstrate a continued need for the frequency allocations we have by pushing forward and documenting our achievements. The ARRL and TAPR Digital Communications Conference is one of the few ways to record our accomplishments and challenge each other to do more.

A Conference for the Beginner, Too

The conference is not just for the digital expert. This year's conference again provides multiple session tracks for beginning, intermediate, and

advanced presentations on selected topics in digital communications. Topics will include APRS, satellite communications, TCP/IP, digital radio, Spread Spectrum, and many others. Come to the conference and hear these topics presented by the experts! Don't miss this opportunity to listen and talk to others in these areas.

Symposia and Seminars

In addition to the presentation of papers on Saturday, three symposia/seminars will be held. These sessions are provided to allow those with additional time and interest to make the most of the Digital Communications Conference. For those who may have interest in just one symposium or seminar, registration for the conference is not required to attend these activities. This allows maximum flexibility for those who may want to participate during the Digital Communications Conference, but do not have an entire weekend to devote to the event.

The Second APRS National Symposium will be held on Friday and will be moderated by Steve Dimse, K4HG (the developer of javAPRS). It will likely include many APRS software authors, such as Bob Bruninga, WB4APR (the father of APRS), Keith Sproul, WU2Z, Mark Sproul, KB2ICI (the developers of MacAPRS and WinAPRS), Brent Hildebrand, KH2Z (the developer of APRSPLUS), and other nationally-known APRS leaders. Join this group for the afternoon and evening for in-depth discussions and presentations on the current and future status of APRS. This is a unique opportunity to gain insight into this fast-growing digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning System).

Starting late Friday afternoon, a half-day seminar titled "Infrastructureless Technologies in Amateur Radio," presented by Don Lemke, WB9MJN, will cover the pros and cons of DDMA (directivity division multiple access, a proposed infrastructureless technigue) versus hubbed (cellular style) and other infrastructure dependant techniques, the basic problem of megabaud rate communications into the ham QTH, and some techniques for channel-area acquisition including full duplex/asynchronous versus simplex/synchronous radio/acquisition concepts. This seminar will start late enough on Friday afternoon to allow those flying that day to attend the seminar.

The Sunday morning seminar will be a combination of two different talks that will make one excellent seminar. The first presentation, by Lyle Johnson, WA7GXD, will focus on the upcoming RUDAK digital communications system scheduled to fly on the AMSAT Phase 3D satellite in the near future. Lyle will discuss features, systems design, integration, and experiments. The goal of the presentation is to zero in on the communications capabilities of RUDAK, the performance to be expected from the 153k6 PSK system, the limitations and capacities of the DSP modems, user requirements for receiving RUDAK, requirements for transmitting to RUDAK, and how amateurs can work to make ground operations a reality once the satellite is in operation. Information on how to submit a proposal for experimental

time on RUDAK will be presented. The second presentation will be by Tim Shepard, KD1KY, regarding "Packet Radio Networks with Millions or Billions of Stations." This talk will present concepts and materials that make you think about different possibilities of networking in the future. Both Lyle's and Tim's presentations focus on different aspects of future digital communications possibilities.

Third Annual ARRL and TAPR DCC Student Papers Award

ARRL and TAPR especially welcome papers from full-time students to compete for the third annual student papers award. Two $500 travel awards may be given, one in each of the following categories: a) best technical/theory-oriented paper by a student, and b) best educational or community-oriented application paper by a student. The paper should relate directly to a wireless digital communication topic (see the guidelines for more information). Papers co-authored by educators or telecommunications professionals are also eligible for this award as long as a student is the first author. The deadline for receipt of finished student paper manuscript is June 20, 1998. Please note that this deadline is different from the general conference paper submission date. For full details and paper guidelines contact TAPR or browse to http://www.tapr.org/dcc.

Call for Conference Proceeding Papers

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the conference is not required for publication. The primary purpose of the conference is to communicate ideas and techniques regarding digital communications. Papers written in an informal style are welcome, as well as those written to academic standards. If you know of someone who is doing great things with digital communications, be sure to tell them about this! Papers are due by August 15, 1998, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111, or via e-mail to lweinberg@arrl.org. The paper submission guidelines are available on-line (http://www.tapr.org/dcc).

Local/International Co-Host

The 1998 ARRL and TAPR Digital Communications Conference will be co-hosted by Chicago Amateur Packet Radio Association (CAPRA). CAPRA is one of the oldest packet radio groups in the US. It focuses on education about amateur packet radio, coordination of joint efforts of hams interested in packet radio, and technical and equipment support for a sound packet network in the Chicago area. They have had high-speed packet networks operational since the mid-1980s. Visit the CAPRA Web site at http://www.imaxx.net/capra for more information.

PRUG (Packet Radio User Group of Japan) will be the first International co-host of the ARRL and TAPR Digital Communications Conference. The conference is proud to welcome PRUG as part of the conference. PRUG will be hosting an informal social Friday evening after the seminar and symposium are completed. Visit http://www.prug.or.jp for more information about the organization.

What can you expect during the 1998 ARRL and TAPR Digital Communications Conference?

* A full day of papers, breakout sessions, and selected topics on Saturday for the beginner to advanced amateur digital enthusiast.

* Three seminars/symposia
Friday (1 PM)
- Second Annual APRS National Symposium,
moderated by Steve Dimse, K4HG

Friday (3 PM)
- Infrastructure Technologies in Amateur Radio
conducted by Don Lemke, WB9MJN

Sunday (8:30 AM)
- RUDAK Future Operations and Experimentations
by Lyle Johnson, WA7GXD
- Packet Radio Networks with Millions or Billions of Stations
by Tim Shepard, KD1KY

* Third Annual Student Paper Awards.

* TAPR Membership Meeting

* A banquet with special guest speaker Steve Roberts, N4RVE, of Nomadic Research Labs. Creator of the Winnebiko and Behemoth high-tech recumbent bicycles. His current project is focused on Microship technology (http://www.microship.com/).

* SIGs (Special Interest Groups) get-togethers on Saturday, following the banquet

* Informal get-togethers throughout the weekend

* A facility that is perfect for this type of conference

* Informal engineering discussions/demonstration areas

* Motorola Museum located in the area.

* An event at which the most important new developments in amateur digital communications are announced

* Digital 'movers and shakers' from all over the world in attendance

---

Conclusion

If you have attended a Digital Communications Conference in the past, remember how much fun it was discussing the latest developments into the wee hours! If you have never been to a Digital Communications Conference, then make your plans now to attend and find out how much fun they can be.

There are few activities where your participation can be so much fun and so important! You will be able to get together with colleagues from all over the world and bring each other up to date on your latest work. Experience all this and more for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to see you at the ARRL and TAPR Digital Communications Conference, September 25-27!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337, Tucson, AZ 85749-9399, phone 940-383-0000, fax 940-566-2544, e-mail tapr@tapr.org, browse www.tapr.org/dcc.

Sincerely,

Steve Ford, WB8IMY, ARRL Conference Co-Chair
Greg Jones, WD5IVD, TAPR Conference Co-Chair
Steve Stroh, N8GNJ, Conference Manager
Mark J. Thompson, WB9QZB, Local Host Liaison
Carl Bergstedt, K9VXW, Local Host Liaison

Note: If you need conference handouts or flyers for ham club meetings, contact TAPR to get what you need!

Hotel Information

Conference presentations, meetings, and seminars will be held at the Holiday Inn Rolling Meadows. Special DCC rooms rates are $85 per night. When making reservations with the hotel, be sure to indicate you are attending the ARRL and TAPR DCC in order to get the discount. It is highly recommended that you book your room prior to arriving. A block of 75 rooms is reserved until August 31, 1998. After the 75 rooms are booked, rooms will only be available in nearby hotels, so be sure to book your rooms early! The hotel provides transportation to and from O'Hare Airport. Please contact the hotel to arrange specific transportation needs.

Holiday Inn Rolling Meadows (conference hotel)
3405 Algonquin Rd
Rolling Meadows, IL 60008
Phone 847-259-5000, fax 847-259-0597

Registration

Contact the TAPR office by phone, fax, or e-mail (numbers and addresses are above) to register or for additional meeting information. MasterCard and VISA are accepted.

- Preregistration (before Sept 1): $42.00 *

- Late registration or at door: $47.00 *

* - Conference registration includes Conference Proceedings, Saturday sessions/meetings, and lunch.

- Saturday Evening Dinner (limited space): $20.00 **

** - Includes dinner, speaker, prize drawing

Seminar/symposia

Note: You do not have to be registered for the conference to attend one or more of the seminars/symposia.

- Friday, 1-8 PM, Second Annual APRS National Symposium (full day)

Registration: $25***

- Friday 3-7 PM, Infrastructure Technologies in Amateur Radio, conducted by Don Lemke, WB9MJN

Registration: $15***

Sunday 8:30-11 AM and 11:30 AM-2 PM, RUDAK Future Operations and Experimentations by Lyle Johnson, WA7GXD, and Packet Radio Networks with Millions or Billions of Stations by Tim Shepard, KD1KY

Registration $20***

*** Cost of seminar or symposium includes the cost of handout materials.

Contact TAPR to register for the DCC:

2504. FlexNet Help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-31 00:00:00 UTC
From: "Jim Hogarth N3DFF"
Message-ID: <6ksiab$9u7@edrn.newsguy.com>
Source record: 23739

I'm trying to set up FlexNet for packet and APRS. I'm using it in lieu of a TNC because I already have and sound card. However, I'm not sure how to connect the terminal program or APRS software to the output of the program. Can someone provide help?

Thank you.

2505. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-05-31 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6kqq23$i6n@news.Hawaii.Edu>
Source record: 23740
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman (KH2PZ / KH6)
(rec.radio.amateur working-group)

Yes, its soft/hardware from Baycom. It works as well as a TNC lacks the ability to run the TNC and radio without a computer of course. Check tigertronics home page for the details. I'm using it with good results. There is also a way to do the same thing using Flexnet and the soundcard driver. I tried it, worked ok, but I couldnt get the audio levels quite right. Just do a search for Flexnet and you should find what you need for that method. By the way, the baycom modem bp-2m will also run as a Hamcomm interface so you can do RTTY, FAX, SSTV etc....73

From: Jeff Kashinsky <kashinsky@earthlink.net>
Message-ID: <3572257F.DF4CC764@earthlink.net>
Source record: 23744

Just upgraded the firmware from 5.0 to the latest.

Kantronics documentation does not include the commands from the last rev
which I never purchased.

What do I have to do to get the tnc and gps talking for APRS?

Commands and parameters would be appreciated.

Jeff W2UA

The signal must be decoded as SITOR (AMTOR in "ham" language). It is
transmitted at 100 Baud. Most multi-mode TNCs can handle it, but some allow
you to filter based on the station ID and/or the type of message.

73 de VE7MDL ....Erik.

MG> Suggestions, comments welcome (newsgroup or email)

We are currently at the University of Oslo radio amaters' club (LA1AD)
creating a MAN (metropolitan area network) using BreezeCOM 802.11
equipment. (about 10km links) We are thinking about using this as an
amateur backbone, but we are not sure whether it is allowed in the
Nrowegian regulations.
For the time being, we are investigating the use of IPv6 and mobile
IP on this network, and the influences of meteorological conditions on
the throughput and delay of these links.

Right, except it is their 222 MHz transverter which is ready to go out of
the box. You have to make a slight mod to their 432 MHz transverter to
speed up TR.

The Earth rotating or the sun moving (not sure what you mean by that) has
nothing to do with prop. Solar activity does. Low activity, 10 is fairly dead.
High activity 10 is wide open. Prop has to do with the ammount of energy
reaching Earth from the sun.

Correct. You are referring to the ADMS-1D and it's a commercial
product which you can purchase inexpensively from your local Yaesu
dealer. I have it ... it's great!

Don't accept bootleg software.
The developers who go to work in the mornings to make this software
also have families with children who like to be fed and go to
college someday. If you copy the software, they don't get paid,
and this is like stealing. That would give me a guilty conscience.

The most popular program of this type for digital modes is probably HAMCOMM by
DL5YEC. One place you can download this popular shareware program is:

http://www.accessone.com/~tmayhan/

There are also a lot of tips and interesting ideas about building the "modem".
The circuit in its simplest recieve-only form has only one active component...
an op-amp IC. Documentation on building the interface is also in the HAMCOMM
documentation. I always got excellent results with the HC interface with 486
class machines, but both of my last two toshiba notebooks, pentium based,
delivered sub-standard performance. Still haven't got to the root of the
problem. I have tried an external power supply which seemed to help somewhat.
I also tried disabling disk cacheing which did not. I think now it is because
of a "jittery" clock in these tosh pentium notebooks.

All the circuit does on recieve is take the recieved audio in one of the inputs
of the op amp and convert it into a square wave of + and - 12V or so, set by
the "rail voltages" of the op amp. This is the kind of signal your serial port
expects to see. The "modem" strictly speaking is not modulating or demodulating
anythiing, just shifting the signal to RS-232 levels. Power supply in the
classic circuit comes from the serial port itself, via either two or four
diodes, typically 1N914s. activee audio filtering can also be added, and an
opto-isolator if you have a problem or are worried about RF getting from your
rig to your computer or vice versa.

On transmit, the simplest version will have a bipolar NPN transistor keying the
PTT or the rig, or maybe an opto-isolator or even a relay which is certainly
better. The AFSK input to the mic jack of the rig comes from either the serial
port or from the PC speaker. For best results it should be filtered and
attenuated. It is easy to over modulate your rig without taking precautions.

Again, an opto-isolator is a good idea. You also can use direct FSK from the com port if your rig has FSK input.

This circuit can also be used for slow scan TV and for HF fax. JVFAX is a popular program for these modes, and it both receives and transmits. There are lots of other programs that use the same interface. Availablee modes are SITOR/AMTOR, CW, RTTY both wide adn narrow shift, ASCII, Packet, NAVTEX, practically every SSTV or FAX mode, and I probably skipped a couple. You can also use most programs as a crude spectrum analyzer or audio frequency counter.

This method is not as popular now as it might be because a sound card can also be used for radio communications and provides the capability of DSP filtering and software based drive adjustment. Still the HAMCOMM dongle is a good introduction to homebrewing or a good alternative for those with no sound board or TNC who want to try other modes besides phone or CW. There are comparator interfaces available ready made from many sources. If you build one, you can get all parts at Rat Shack, but substitute the TL082 op amp for the 741. The TL082 is a dual op amp so you could use one side for an active filter and the other for the comparator. The pin-out for the device is on the back of the package and is a little different from the 741.

I believe HAMCOMM also does header filtering. It even has NAVTEX as a separate
mode in the menu.

2528. What TNC is best???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-01 00:00:00 UTC
From: rrickets@ix.netcom.com
Message-ID: <35729591.1674551@nntp.ix.netcom.com>
Source record: 23756

I've set up my first packet station using a PK232 with version 7.0 firmware, fed from an IC-207 (144 & 440MHz), and using Pakkratt 2.0 for windows on my laptop.

While everything seems to work, more or less, I'm wondering whether the TNC should be of newer vintage, or whether it makes a lot of difference. I've had a bit of a problem getting the threshold set just right on the PK232. The audio level coming from the dataport on the IC-207 seems lower than optimal. While I could rewire the cable to use the external speaker output, I then wouldn't be able to monitor the bursts by ear.

So my question is whether I should shop around a bit for a newer TNC, and if so, what would be a good choice, considering the radio I'm using.

Thanks and 73,

Ron KD5EFD

This is the approach used with the simple BAYCOM modem, basically just a
TCM3105 modem chip (no longer made) interfaced to the PC via a COM port,
with the HDLC stuff running on the PC. It works quite well.
Alternatively, a DSP system or a soundcard running modem software can be
used with FLEXNET. Try a web search for FLEXNET and BAYCOM.

Hi
I am looking for the datasheet of the CX7925B1 from Sony.
It's a PLL and a discontinued part from Sony datasheet server.
Thanks for answer.

I have a spare Tasco uTNC-21 I'm willing to sell.
This is the same TNC Heath sold as the HK-21.
Has internal battery. Working fine. I don't need it anymore.
Make offer.

2533. The AA2HS problem. NYC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-01 00:00:00 UTC
From: abrankodxxx@usa.net
Message-ID: <abrankodxxx-0106981613270001@207-172-192-95.s32.as2.nyd.erols.com>
Source record: 23761

I live in NYC and am fairly new to packet.. I have now discovered that the main packet freq here in NYC 145.05 has been taken over seemingly by AA2HS's beacon operation... He must send his beacon every 5 or 10 SECONDS... It ties up traffic so badly that i get disconnected from all the PBBS' that i attempt to log onto because of timeouts. I was wondering if there was any current FCC action against this person. Its driving me and probably everyone else operating packet in NYC nuts.

I'll admit that the subject may be off topic for some of the news
groups it is posted to, but I did not post the original thread to these
new groups. My point in asking the question was to confirm my belief
that most Hams also enjoy firearm related activities. There was no
intent "to pollute" any newsgroup(s). If you felt my question was
irrelevant or ridiculous you could have ignored it. However, I will
apologize for any inconvenience it caused you. At the same time though,
you might consider acting with more maturity and avoid personal attacks
in the future.

Really? Aren't they both hobbies, or recreational activities? As hobbies, don't they both empty your bank acoount and fill your free time? Don't many individuals enjoy participating in both hobbies. Don't you run into many people also interested in the second activity while you're at an event related to the first one? Aren't they both valuable tools with great power? Haven't both served to prevent crime and save lives? Haven't both been abused or used in a criminal manner? Haven't both been attacked in the name of law enforcement and crime prevention? Haven't repressive regimes sought to confiscate both items from their subjects?

I'll admit that the subject is off topic for some of the news groups it is posted to, but I did not post the original thread to these new groups. My point in asking the question was to confirm my belief that most Hams also enjoy firearm related activities. If you felt my question was irrelevant or ridiculous you could have ignored it. I apologize for any inconvenience it caused you. By the way though, judging by the response I've seen, I'd have to say by belief is correct - most Hams also enjoy firearm related activities...

Here are some of the technologies. No, this isn't
a sales pitch, just some of the bandwidths we
install and all of them are off the shelf.

2.4 GHz Dual T-1/E-1
2.4 GHz 1, 2 and 4 mbps Ethernet
6 GHz Single T-1 up to 6 T-1, DS-3 (45 mbps) and 155 mbps (STS-3)
10, 11, 23 Same as 6 GHz in addition to 10 or 20 mbps Ethernet and up to
quad T-1/E-1
Laser 155 mbps
6 GHz Rack and stack OC-3c up to OC-12 (622 mbps)

There's plenty of bandwidth - its the modulation scheme which is important.
Most of this stuff is QAM.

Ken McLeod
CSG Wireless

I've found the gun crowd to be more friendly than many hams around here,
having butted heads 2 years ago with some radio club officer assholes
and prima donna ARES assistant EC gloryhounds.

Both are fun, relatively safe and expensive. But when they're no longer
fun, it's hasta la vista, Baby!

hope to hear you on pactor.usually 14.065 to 14.080 lsb dial reading
works for me. there is quite a bit of rtty above 14.080 to say 14.095
Might try some 10 meter packet using 1200 baud in the bottom half of the
novice subband ,28.195 +/- not sure about the other
hf. bands , 40 just below the novice part and pactor /amtor.
mike AA7QA phoenix az.
ps the wx should be 100 +! and over 80 ant 6,000 ft.
will need 2 gallons of water per operator(steam power) hi hi

I don't think there's ever been any shortage of experimentation ...
just that the equipment costs haven't come WAY down and been
made widely available. It would seem that something along the lines of a $200
radio/modem combo that could work as a node or terminal would be required to
get a mass movement away from 1200 baud.

If our computers were keeping down with the tnc technology/status quo we'd all
still be running 8088 equipment.

Something I thought might inspire some movement would be a set of microsats -
one always visible - on an equitorial orbit (like the fialed french bird)
which simply 'repeated' normal packet bbs traffic at 9600 bps (or faster).
Reception with even a scanner would be possible. Just a thought but some sort
of project that doesn't require a '$erious$' satellite station to play.

I've tried, but FBB 7.00 has some problems with BPQ...
I set PACLEN 200 in port.sys of FBB and PACLEN 120 as default PACLEN
value in BPQCFG.TXT (I want use paclen=120 for node only) and then I
use PACLEN=200 in PORT section of BPQCFG.TXT.
At the beginning FBB works well and paclen is 200.
After I have used the switch for any reason, paclen becomes 120.
I know that I could change all paclen setting all to 200, but I want
to use 120 for node because teher are a lot of station with not good
link.
With FBB 5.15c all works well.
But There is this problem with mem under win...

Hello all,

I was wondering if anyone has a copy of either a nelson or clarkson packet driver for the 3Com 3C-515Tx NIC. I am looking to run a packet -> intranet gateway and I only have an ISA port in the machine, so I must use either a 3Com or an Intel ISA type card. I have successfully run a PCI card with the apporiate PCI driver, so I know that this will work. I plan on running JNOS 1.11x5 under MSDOS.

73 and Thanks,
de Chris

Hello, reader.

Could anybody explain how SSTV works? That is, I can hear the tunes, but what do they mean? How the tunes are used for Marin, Scottie? What about the VIS code? If you know where to get the info, please, let me know.

2553. MFJ-1278, no STA/CON leds during calibrate...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-03 00:00:00 UTC
From: lanshark@bellatlantic.net
Message-ID: <6l2f02$7ne@world1.bellatlantic.net>
Source record: 23781

Anyone have an idea on what would cause an operating MFJ-1278 to not light its STA/CON leds during the method 2 calibration?

All jumpers are in place, the proper mode is set (HP for cal of the tuning indicator), calset is 250 per the manual, low tone selected and TNC keyed, I twiddle (slowly!) R106 and no go on the lights. I'd like to do the 300 baud HF modem successfully before I go messing with the working 1200 baud VHF packet trimpots...

I'm running version 3.4 code, 32k multilevel.

Thanks!

Jim N8AVX

2554. Electronic Fundamental text books FS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-03 00:00:00 UTC
From: W8EK@usa.net
Message-ID: <6l3ctntjo1@nnrp1.dejanews.com>

I have the following books for sale. All are text books used for Electronic Fundamentals (DC Theory, AC Theory, and electronic devices) at the Technician (Associate Degree) level.

All books are either new, or "almost new."

Electronic Devices and Circuits by Hassul
with student solution manual, still in shrink wrap $ 40

Electronic Principles by Malvino - 6th edition - 1999 (that is what it says in the book) $40

Basic Electronics by Grob - 8th edition - 1997 $ 40

Electric Circuit Fundamentals (3rd Edition) and Electronics Fundamentals (3rd edition) all in one book - 1995 $ 40

Electronic Devices and Circuit Theory by Boylestad
6th edition - 1996 $ 40

Electronic Devices and Circuit Theory by Boylestad
5th edition - 1992 $ 20

Linear Circuit Analysis by Davis - includes CD ROM
1998 $ 25

Digital Electronics by Uffenbeck - 1994 $ 20

Electricity - Principles and Applications by Fowler
2nd edition - 1994 $ 18

Circuits by Carlson - Preliminary edition, in paperback
1996 $ 15

Prices do not include shipping from NE Ohio.

Thanks.

N6GN came up with an interesting microwave link project which uses
direct FM on a *real* MA/COM Gunnplexer. It won't work very well with
one of those proximity sensor knock-offs. See
http://www.tapr.org/~n6gn/uwavelink/uwv.html for details.

Good Luck.

The MIDXA web pages at:

http://www.guam.net/pub/midxa

are now also mirrored at:

http://www.qsl.net/midxa

Site contains pictures of shacks and antennas in the
Mariana Islands, QSL info, a QSL gallery, visiting
DX'ers pages, club information and history, digital
voice keyer software, photo tour of KH7R's QTH,
island pictures, and a bunch more.

Lots of pictures.......

Hams who were in the military during WWII in the
Mariana Islands may be interested in viewing the
pictures of Tinian island on the Club Photos page.

While AA2HS has been a problem for a few years now, there has been nothing
that I have heard that would be "enforcement" actions. There are other
packet frequencies in the area. Give me a call and I'll fill you in
on what is available in the NYC area. I run a BBS on Staten Island.
My office number is (212) 390-9031 from 11AM-6PM.

Jim,

The Tucson Amateur Radio Packet Radio club has been experimenting with 19.2K, 56K and higher speed packet equipment. Check out:

http://www.tapr.org

There is also commercial off-the-shelf units that run in the unlicensed Industrial/Scientific/Medical (ISM) bands at 900 MHz, 2.4 GHz and 5.8 GHz.

Check out:

http://hydra.carleton.ca/info/wlan.html

T1 speed equipment is a bit expensive, but the 128K and 256K stuff is fairly reasonable and will work over long distances.

Cheers,

Keith Little

Dear fellow digital freaks,

Athough I have never used Hellschreiber, I have heard of it and remember reading about a mechanical contraption in 'Electron' years ago, complete with a picture of the paper tape with slanted text on it.

It would be interesting to know how Hell compares to modern digital modes such as Pactor 1 & 2. Will it give readable copy right into the noise floor?

Either way, it sounds like a simple and clever way of transmitting data that would have been ahead of it's time when invented by Rudolf Hell.

Am I correct in assuming Hell is transmitted as carrier/no carrier (CW) and can be received through a CW filter? I have a PTC-II controller which can be pressed into service as a narrow band LF DSP filter and could be made to drive a comperator style demodulator with JVFAX and the Hell add-on script.

Hello all,
I have a Yaesu FT-5100 dual band mobile radio which I would like to use for 9600 baud packet. I have looked through a few modification indexes for this radio, but have not found any regarding 9k6 packet operation. Does anyone out there in netland know if this can be done, and if so, where can I get the information to do it?
Thanks in advance! Reply to: dgravatt@falcon.cc.ukans.edu

FIRST CALL FOR VOTES (of 2)

Votes must be received by 23:59:59 UTC, 22 Jun 1998.

This vote is being conducted by a neutral third party. Questions
about the straw poll should be directed to the rec.radio.amateur.*
Working Group at <rra-wg@theporch.com>

Votetaker: Jeremy Billones <billones@primenet.com>

STRAW POLL Q & A

Q: Who is doing this?
Q: How may I join the rra-wg?
Q: Why are we doing this?
Q: What are we doing?
Q: More to the point, why are we "kicking over this hornet's nest?"
Q: Why do you want to change the newsgroups again?
Q: Who are you to tell us what to do with "our" newsgroup?
Q: How long ago were each of the rec.radio.amateur.* newsgroups created?
Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and
rec.radio.swap included in this opinion poll?
Q: Where can I obtain a copy of the original newsgroup charters?
Q: Where can I find out more information about the Usenet RFD/CFV
process?
Q: I don't want any of the newsgroups to change. What should I do?
Q: I want to go back to one single newsgroup for amateur radio on
Usenet, like we had back in the 1980's. What should I do?
Q: I support some of the newsgroups for amateur radio, but not others.
What should I do?
Q: I support the existence of a newsgroup, but disagree with its
charter. How should I vote?
Q: I would like new newsgroups to be created, what should I do?
Q: I have no opinion, what should I do?

Q: Who is doing this?

The rec.radio.amateur.* Working Group (rra-wg@theporch.com, which
initiated the last major reorganization in 1993) is the point-of-contact
for questions about this opinion poll. Principal members are Paul
W. Schleck, K3FU, and Jeffrey Herman, KH2PZ. Though not an rra-wg
member, Gary Coffman, KE4ZV, also endorses this opinion poll. this
opinion poll will be conducted by an unbiased third party from the
Usenet Volunteer Votetakers (UVV), Jeremy Billones

(billones@primenet.com).

Q: How may I join the rra-wg?

Anyone who volunteers may join the rra-wg. The rra-wg has always solicited volunteers from when it was created in 1993 (originally named rra-reorg) to draft an RFD to reorganize the rec.radio.amateur.* newsgroups (and continues to serve as an advisory group for FAQ maintainers and new newsgroup proponents). You may join the rra-wg by subscribing to its mailing list.

The automated list manager address is

listproc@theporch.com

Use this for subscribing, unsubscribing, getting archived info, getting the FAQ message, changing your address, etc.

To subscribe, send a message to this address with "subscribe rra-wg <your name>" Similarly, to unsubscribe, replace "subscribe" with "unsubscribe"

The list owner address is

listown@jackatak.theporch.com

Use this address only when there is a problem which really truly can't be resolved otherwise.

Q: Why are we doing this?

Discussion on the rec.radio.amateur.* newsgroups shows that there is a difference of opinion about the current newsgroups and their charters. Assertions on one side of the argument that the charters were voted upon by the readers have been countered with assertions on the other side that the votes took place years ago, by a very small minority of the current readership. There is also the strongly-held opinion among some that we have "too many newsgroups." The following is a sample posting from the discussion thread on rec.radio.amateur.misc that led to this opinion poll (the entire thread may be viewed at DejaNews, http://www.dejanews.com/):

Q: What are we doing?

As a preliminary (and perhaps even diverting) step to an RFD (which would be very laborious and time-consuming, and perhaps unnecessary), we will conduct a Straw Poll, or "Vote of Confidence" (similar to the vote of confidence for a Prime Minister made by British Parliament, or a non-binding resolution of the U.S. Congress). We do it Usenet-vote style (utilizing a neutral vote-taker from the UVV). During the poll, a vote is taken where a "Vote of Confidence" yeah or nay for each newsgroup, as currently constituted and chartered, is given by each voter (YES/NO/CANCEL/ABSTAIN votes are valid).

What votes mean:

YES: I support the existence of this newsgroup and its charter

NO: I disagree with this newsgroup's charter or I believe that this newsgroup's existence should be reconsidered in a future RFD/CFV

CANCEL: Delete any previous votes I made concerning this newsgroup

ABSTAIN: I have no opinion concerning this newsgroup

Each newsgroup that does not pass a vote of confidence by Usenet voting standards (2/3 and 100 vote majority of YES versus NO votes) may be referred to the Usenet newsgroup creation process where their deletion or modification (based on a rough consensus of the preceding 30 days of discussion and how much they lost in the vote of confidence) is proposed. Each newsgroup that does pass a vote of confidence will have its charter, and justification for existence, reinforced to the

readership (as the current readership voted on it).

Q: More to the point, why are we "kicking over this hornet's nest?"

Sometimes hornet's nests can get big enough that they wind up falling down anyway. As shown in the thread above, there are significant undercurrents of disagreement over the current newsgroups, their charters, and even the suggested guidelines and rules of net-etiquette that many on the newsgroups advocate. If this opinion poll shows strong agreement with current practices, then that would help reduce (though not eliminate) newsgroup arguments on the subject. If, however, this opinion poll shows strong disagreement, then it's probably better that we know that right away, and take steps to fix the current situation before it degrades any further.

Q: Why do you want to change the newsgroups again?

Only some of the proponents of this opinion poll wish to change the newsgroups. Some wish to simply have the current newsgroups and their charters reinforced. All of the proponents agree that an up-to-date opinion poll of the readership is desirable at this time. Whatever future actions will be taken will be determined by the results of this opinion poll.

Q: Who are you to tell us what to do with "our" newsgroup?

One answer is that on Usenet, no one "owns" an unmoderated newsgroup. Newsgroups are voted into existence by a democratic process to determine consensus (and lack of significant objection) for using shared network resources to support them. All of the existing rec.radio.amateur.* newsgroups passed such a vote at some time in the past, and should pass such a vote again if there is strong support for their continued existence.

Another answer is that this is just a non-binding opinion poll of the readership to determine a consensus, if any, for making changes. It would still be necessary to undertake a formal RFD/CFV process to change any Usenet newsgroup (and that was always possible, anyway).

It should also be emphasized here that no individual rec.radio.amateur.* newsgroup is being singled out. Rather, a consensus of the readership concerning ALL rec.radio.amateur.* newsgroups is being sought.

Q: How long ago were each of the rec.radio.amateur.* newsgroups created?

1972 (or possibly earlier, this date is when UCSD joined the ARPANet):

Info-Hams (original ARPANet mailing list at Simtel-20, continues today at UCSD as a gateway of rec.radio.amateur.misc)

1979:

Creation of Usenet News at Duke and UNC

early 1980's:

fa.info-hams (fa = "From ARPANet") *
net.ham-radio (pre-Kent Paul Dolan "Great Renaming") *

mid 1980's-1991:

rec.ham-radio *
rec.ham-radio.packet *
rec.ham-radio.swap *

1991 Reorganization:

rec.radio.amateur.misc
rec.radio.amateur.packet *
rec.radio.amateur.policy
rec.radio.cb
rec.radio.swap

1992/3 Addition:

rec.radio.info

1993 Reorganization:

rec.radio.amateur.antenna
rec.radio.amateur.digital.misc
rec.radio.amateur.equipment
rec.radio.amateur.homebrew
rec.radio.amateur.misc
rec.radio.amateur.policy
rec.radio.amateur.space

1996 Additions:

rec.radio.amateur.dx
rec.radio.amateur.boatanchors

* = obsolete

Current newsgroups covered by this opinion poll, and the years
in which they were created:

rec.radio.amateur.antenna (1993)
rec.radio.amateur.boatanchors (1996)
rec.radio.amateur.digital.misc (1993)
rec.radio.amateur.dx (1996)
rec.radio.amateur.equipment (1993)
rec.radio.amateur.homebrew (1993)
rec.radio.amateur.misc (1991)
rec.radio.amateur.policy (1991)
rec.radio.amateur.space (1993)
rec.radio.info (1992/3)
rec.radio.swap (1991)

Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and
rec.radio.swap included in this opinion poll?

Though one level up in the rec.* hierarchy, these newsgroups are principally used by readers of rec.radio.amateur.*, and their fates would substantially be decided by any significant reorganization of the rec.radio.amateur.* newsgroups. Though created by a rec.radio.amateur.* reorganization, rec.radio.cb is not included in this opinion poll.

This announcement has been cross-posted to all rec.radio.* newsgroups (except for rec.radio.broadcasting and rec.radio.info, which are moderated). In addition, the following individuals were consulted prior to this announcement (note that consultation does not necessarily imply endorsement):

Richard Eckman, KO4MR, Proponent of rec.radio.amateur.dx
Brian Kantor, WB6CYT, Administrator of Info-Hams/Ham-* mailing list gateways of rec.radio.amateur.* newsgroups at UCSD
Ian Kluft, KO6YQ, Proponent of 1993 rec.radio.amateur.* reorganization, former rec.radio.amateur.* FAQ Maintainer
Jay Maynard, K5ZC, Proponent of 1991 rec.radio.amateur.* reorganization
Brian Short, K7ON, Moderator of rec.radio.info
Rick Stealey, K2XT, Proponent of rec.radio.amateur.boatanchors

Q: Where can I obtain a copy of the original newsgroup charters?

ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.info
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur-reorg
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.dx
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.boatanchors

Q: Where can I find out more information about the Usenet RFD/CFV process?

ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Create_a_New_Usenet_Newsgroup
ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Format_and_Submit_a_New_Group_Proposal
ftp://rtfm.mit.edu/pub/usenet/news.groups/Guidelines_on_Usenet_Newsgroup_Names

Q: I don't want any of the newsgroups to change. What should I do?

Vote "YES" for all of the existing rec.radio.amateur.* newsgroups.

Q: I want to go back to one single newsgroup for amateur radio on Usenet, like we had back in the 1980's. What should I do?

Vote "NO" for all (or all but one) of the newsgroups.

Q: I support some of the newsgroups for amateur radio, but not others. What should I do?

Vote "YES" for any newsgroups that you wish to remain unchanged, and vote "NO" for any newsgroup you wish to have reconsidered in a future RFD/CFV.

Q: I support the existence of a newsgroup, but disagree with its charter. How should I vote?

Since this opinion poll is for both the existence of given newsgroups
AND their current charters, you should vote "NO" for that newsgroup.
Again, this is a non-binding opinion poll simply to determine if current
newsgroups should be considered for modification or deletion, not a vote
to actually modify or delete these newsgroups.

Q: I would like new newsgroups to be created, what should I do?

Creation of new newsgroups is not being considered by opinion poll. A
future RFD/CFV would have to be initiated to do this. You are, of
course, welcome to express your opinions concerning new newsgroups by
posting them to rec.radio.amateur.misc (*NOT* by E-mail to the
vote-taker).

Q: I have no opinion, what should I do?

You may wish to read the preceding 30 days of public discussion on
rec.radio.amateur.misc about this opinion poll to develop your own
opinions (go to http://www.dejanews.com/ and search for "STRAW POLL").
If, after reading the public discussion, you still remain undecided, you
may abstain from this opinion poll. You may do so informally by not
participating in it at all, or formally by explicitly voting "ABSTAIN"
for all of the newsgroups.

IMPORTANT VOTING PROCEDURE NOTES:

Standard Guidelines for voting apply. One vote per person, one account
per voter. Votes must be mailed directly from the voter to the votetaker.
Anonymous, forwarded or proxy votes are not valid. Votes mailed by
WWW/HTML/CGI forms are considered to be anonymous votes.

Vote counting is automated. Failure to follow these directions may
mean that your vote does not get counted. If you do not receive an
acknowledgment of your vote within three days contact the votetaker
about the problem. It's your responsibility to make sure your vote
is registered correctly. Duplicate votes are resolved in favor of
the most recent valid vote. Addresses and votes of all voters will
be published in the final voting results post.

HOW TO VOTE:

Extract the ballot from the CFV by deleting everything before and after
the "BEGINNING OF BALLOT" and "END OF BALLOT" lines. Don't worry about
the spacing of the columns or any quote characters (">") that your
reply inserts. Please, DO NOT send the entire CFV back to me!

Fill in the ballot as shown below. Please provide your REAL NAME and
indicate your desired vote in the appropriate locations inside the ballot.

When finished, MAIL the ballot to: < voting@clark.net >
Just "replying" to this message should work, but check the "To:" line.

Examples of how to properly indicate your vote:

```
[ YES ] example.yes.vote
[ NO ] example.no.vote
[ ABSTAIN ] example.abstention
[ CANCEL ] example.cancellation

DO NOT modify, alter or delete any information in this ballot!
If you do, the voting software will probably reject your ballot.

If these instructions are unclear, please consult the Introduction to
Usenet Voting or the Usenet Voting FAQ at http://www.iki.fi/~jpatokal/uvv.

======== BEGINNING OF BALLOT: Delete everything before this line =======
.-------------------------------------------------------------------
| 1ST STRAW POLL: rec.radio.amateur.* reorg
| Official Usenet Voting Ballot <RRSP-0001> (Do not remove this line!)
|-------------------------------------------------------------------
| Please provide your real name, or your vote may be rejected. Place
| ONLY your name (ie. do NOT include your e-mail address or any other
| information; ONLY your name) after the colon on the following line:

Voter name:

| Insert YES, NO, ABSTAIN, or CANCEL inside the brackets for each
| newsgroup listed below (do not delete the newsgroup name):

Your Vote Newsgroup
--------- ------------------------------------------------------------
[ ] rec.radio.amateur.antenna
[ ] rec.radio.amateur.boatanchors
[ ] rec.radio.amateur.digital.misc
[ ] rec.radio.amateur.dx
[ ] rec.radio.amateur.equipment
[ ] rec.radio.amateur.homebrew
[ ] rec.radio.amateur.misc
[ ] rec.radio.amateur.policy
[ ] rec.radio.amateur.space
[ ] rec.radio.info
[ ] rec.radio.swap

======== END OF BALLOT: Delete everything after this line ==============

Ok if it work with other. how about the number of users? is it set to a
low number- that might get a busy. might check to parameter controling
which station can connect don't remember the name but it allows certain
station to be rejected. is there a local node? might try connecting to
the node and have the node connect to your mailbox.

2573. 1st Straw Poll: rec.radio.amateur.* reorg

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-04 00:00:00 UTC
From: rcrusoe@aol.com
Message-ID: <1998060419413400.PAA03997@ladder01.news.aol.com>
Source record: 23801

I am against, in principle, the changing of any of the existing groups to a moderated group. However, I would favor the establishment of a new group, to be moderated from the start, aimed especially at new hams or those curious about amateur radio. While all the bickering, flaming, and stuff can at times be entertaining, and we can always drop the group for a few days while things cool off and get back on track, somebody curious about amateur radio who stumbles across one of the r.r.a. groups during a major flame war will not be favorably impressed, and he will likely forget all about amateur radio. However, if there existed a MODERATED group, with a name like "rec.radio.amateur.newbie.moderated or rec.radio.amateur.help.moderated, where a newbie could post what to him is a serious question, and get one or more serious replies, the same ham-curious person might be more inclined to get a ticket and get involved in the hobby.

The old timers among us don't need a moderated group... we all have well-developed BS filters. The newbies, on the other hand, should not be exposed to some of the abuse here just because they have a question or a general curiosity, and certainly should not be flamed for being interested in radio because somebody is just out for a troll or has an attitude problem with the ham community at large.

Before anybody asks me why I don't do something about the problem personally and work towards establishing and maintaining a moderated group, I will point out that I am not yet knowledgeable on the subject to the degree needed for such a project, being rather new to the whole internet scene, and I am out of touch for months at a time while I am working. Somebody else will have to do the legwork, though I will help in any way I can when I am home.

Also, since there is so much cross-posting in r.r.a., I am going to vote "NO" on at least few groups. If we eliminated two or three, we would have that many fewer duplicate posts to wade through. When I still read all the rra groups, I spent more time deleting crossposts than reading. Since we can't prevent crossposting by those who insist on it, I suggest reducing the number of groups they can crosspost TO.

Analyzer2000 ist an indispensable tool for every radio amateur and other people, working with signals in the audio frequency range.
It's running on Windows95/NT and needs no additional hardware, only a sound card!

download at
http://members.aol.com/btf1

features/benefits:
+superfast spectrum analyzer with full control over span, dynamic range and resolution bandwidth
-> switch your radio to SSB and you will have a professional IF-panorama for free!
+time analysis with oscilloscope and envelope display
-> use Analyzer2000 as a digital scope with trigger, grid, single shot and more!
+superhighspeed waterfall display with several coloring schemes
-> use this sonagram to see time/frequency agile signals with a resolution of less than 50us!
+several tools like level riding markers with delta function, averaging, peakhold...
-> measure fsk-shift, harmonic distortion or intermodulation with only a few mouse clicks!
+fft-based morse decoder
-> decode several CW signals within one band simultaneously with automatic speed and threshold control!
+realtime processing thanks to the multithreading architecture
-> do not lose any sample even on slow machines
+20 seconds post trigger memory
-> analyze the signal several times with different settings
+Snapshot and recording feature
-> save your signal to a wave file (last 20 seconds or all new)
+Analyzing of standard wavefiles
-> analyze signals from former sessions or other stations

Available or coming options:
+Low IF input on 11.025 kHz +/- 5 kHz for real IF analyzing capability
+TCP/IP server for remote controlled operation (via LAN/WAN) with multi client capability
+Baseband analysis with constellation diagram, phase diagram, frequency diagram for signal classification
+Demodulation of FSK/PSK signals with bit analysis

dowmload a full funcional shareware copy at

53Kbps is the wired modem topspeed. A T1 can be 24 channels of 64K or a
datastream of 1.56Mbps still somewhat slow...

Tim,

I have bad news, the baycom will not work on APRS. I have written wb4apr many times asking him if he would consider baycom support in future versions, but so far there aren't any versions. I have tried the L2 idea as well as using the NOS packet driver for the baypac, but no success.

Germany has very strict rules about preserving heritage and the look
of the community (sort of like some folks in this country are trying). The
younger set is running as fast as they can from the past, sometimes ridding
themselves of the good as well as the junk.

> bob n6fri

1.536 Mbps actually using 24 64kbps clear channels. If you think it
is slow, then feel free to just keep using your 1200/9600 baud junk.
The point I am making here is that T1 CSU/DSU units are reasonably
priced, and leave room for tranceiver development. If you want an
appliance, then just call apple or black box and pay the thousands
that they want.

since we announced fastbreak, i forsee a market glut of used T1
CSU/DSU units in the near future.

the idea here is to keep costs low. 1.536 Mbps is more than adequate
for most anything, you can put several MPEG2 streams over that kind of
bandwidth for "ATV" use, as an axample.. used T1 CSU/DSU boxes go for
several hundred dollars, while these RF network black boxes go in the
range of several thousand...

anyhow, like i said, only like-minded technically adept individuals
need reply to my original posting.

jim

Please forgive my relative ignorance about these radios, but this seemed to be a good place to find some answers. I have two ethernets that I want to connect using a radio link. I have seen many 900Mhz and 2.4Ghz spread-spectrum radios, but I don't know enough about them to make a good decision. I need something with at the very least 128k, but I would prefer a faster link, in the 1-3 Mbit range. The two ethernets are about 3km apart, and are almost line-of-sight..... with some towers I can probably make it, though it would be easier if I did not need to, e.g. something that can handle trees. What are my best options for this?

Thanks,
Chris

Jim,

Perhaps packet is not the way to go on 6m. I would propose Pactor as the best way to work DX. The mode allows you to have a 500 Hz bandwidth and a good controller with proper error correction. That would allow you to work through QSB and QRM when the band is open.

Vincent,

Use AMTOR (same as SITOR) mode for reception. The speed is 100 Baud. Mode is FEC (as opposed to ARQ). You will find several TNCs and software for sound cards and even homebrew and kits that can receive the mode.

Since this was sent to uk.radio.amateur should we not be talking about
E1 at 2048kbps? That's 30 (or 31) channels of 64k, maybe STM-1e would be
better.

Erik:
Actually RTTY would be better yet. NO sync required and some
info can be extracted with only the capture of bits and pieces of a
transmission. On the other hand, tuning criticality not much a factor
when using FM modes -- although stronger signals are required.

For now, I'm beaconing on 50.62 FM 1200b.

Gun issues have nothing to with radio. We have our own political
problems. The only thing that you are showing us is that radio
users are under the same attack as gun owners. Most likely
will cause us to unite with them.

I would say that, however, the policies of the Left have had more
to do with decline of the West (to include the US) than just guns.
Gun violence is a symptom of deeper problems in our culture. In
countries such as the UK and Canada they have had to also ban
knives and martial arts tools. Amateur Radio could help by giving
the youth a hobby that could fill the emptiness in their lives.

2601. Help with PK-88 & WIN95?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-07 00:00:00 UTC
From: herbr@netcom.com
Message-ID: <herbrEu78oF.5s5@netcom.com>
Source record: 23683

I have an old PK-88 that I am trying to use to get back on packet with a pc running WIN95.

I can't seem to establish communications with the TNC. I am using a standard 25 pin to 9 pin serial cable, and I am not sure if this cable needs to be wired differently, or whether a stock 9 to 25 serial will work.

I can't seem to initilize the tnc, or get any sign on message. When I power up the tnc, I do get a couple of gibberish characters, and I have tried hitting the *** key, as will as setting different baud rates in WIN95, with no luck. By the way, I am using hyperterminal, with a direct to comm port 1 setting.

I know I must be over looking something, as this tnc did work a few years ago, with the packet gold software.

Thanks for any help or suggestions.

Gun owners, Amateur radio, private pilots, and the internet are under the same attack for the same reasons : they are activities that lessen government control. Radios have always been feared by governments more than guns. They provide a means of getting out news the government doesn't want published. Make no mistake, free speech is right behind guns on the hitlist.

For what its worth , Ive been playing around with NCRs Wavelan Wireless Ethernet cards now for about 3 years , having also gotten totally sick of the incredible slowness of the normal packet radio type modems.
The cards I am using only cost me $500 each , run at 2 mbits/sec in the 2.425 Ghz band and I can get ranges of up to 5 kms using 24dbi gain Conifer mesh reflectors.
The only down side of the NCR cards is that they are now obsolete, and have been replaced with newer smaller half length cards which cost double the price.
I dont see that Amateurs have to use equipment that operates in the ham bands only.
If stuff can be used in the ISM bands as well , why not use it.
Ive also had a pair of Proxim Rangelan 900 Mhz cards running a Rf link from my house to work , (4 kms with a heap of obstruction loss) for over 6 years now.
These cards run at 242 kbits/sec and have sufficient power / rx sensitivity to handle 20 km paths with gain antennas.
I dont think theres any point re inventing the wheel.
The simplest solution would be a transvertor which takes the output of a 900 Mhz ISM Ethernet card and converts it down to 450 Mhz.
The other really interesting option is TAPRS 900 FH modem , which if it is a success will totally improve ham packet radio.
The other promising option is the Harris Prism DSS chipset which provides all the bits necessary to run 2 M/bits on 2.45 Ghz.

If you take the bettery out(remove jumper in new models)
all that happens is pcpackrat loads all the parameters ,
which it does anyway.
you might try slowing down the data rate between
the computer and the tnc. the start up lockup might
be related. if the pk232 is in host mode other programs will not
be able to run the tnc.
use a dumb terminal and see what the data looks like on start up
a capital CON is a statement that it is host mode.
there is a trouble shooting section in the pack of the pk232
manual.

2619. Low data rate RF ASCII transmission

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-08 00:00:00 UTC
From: Albert Putnam <Putnam@cimetrics.com>
Message-ID: <6li5uc$c2s$1@news1.channel1.com>
Source record: 23697

Looking for an RF system (spread spectrum unlicensed
in the 900 MHz range is prefered)
that can transmit RS232 ASCII character streams
reliably over distances of about 100 metres.
Looking for an extremely inexpensive solution
with bi-directional multi-station capabilties if possible.
Has to come in under $50 per station.
I am dreaming you say?
My "allowance" is that data rates can be REALLY REALLY
low (around 10bps - YES ten bits per second).
Everything I have seen seems to tout high speed
data transfer performance. I do not need it or want it.
I want cheap and easy to use and install,
and can live with low data rates.

I feel the same way. Anybody can use the bands they are designed for as long as the equipment is approved as an ISM device. If the HAM Radio community will not settle on a high speed standard, I think its the radio community's only recourse anyway. While 1200 baud is annoyingly slow, at least it is standard. Its one of the many facets of the hobby that must be addressed before a truly maintainable digital packet switched radio network can come online.

One other thing I think would be instrumental in advancing packet, is a standard way to use packet, like the telephone and cable companies are doing with cable and ADSL. That is, build a modem that makes the medium generally transparent to a single ethernet connection. I had used this idea some time ago in a past discussion here, and I believe I was told I was crazy or asked what use that would be. These companies have basically confirmed my own opinion. Ethernet cards are only 20 bucks or so, now, if you can live with a NE2000 type (most could at link speeds between 1.2Kbps or 56Kbps links). Even a mere ethernet to TNC kiss adapter using a 68000 processor or such could reinterest many in the hobby, as they wouldn't be forced to deal with . Even BBS useage would blossom, and instead of BBS programmers or other programmers for that matter, worrying about their own custom protocol stacks, etc, they could actually concern themselves with quality of interface, network design, etc. It seems to me that on the hardware and driver level software of packet radio, must experimenters have been content to redesign the PC interface everytime a new high speed device is introduced. To move forward, this is quite unacceptable. I guess its more of a mentality I also admittedly suffer from as a engineer-- it wasn't built here.

These are the fields I could assist from. There are many other problems that need to be addressed by others more skilled in those areas than I, like RF engineering and the social engineering of the society. Join in, it could be fun....

Pearce

Try an INMARSAT terminal. That will also summon help much
quicker when your boat starts to sink than packet radio
will.

2626. FlexNet won't receive?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-09 00:00:00 UTC
From: dkite@my-dejanews.com
Message-ID: <6ljb8f$e3r$1@nnrp1.dejanews.com>
Source record: 23704

I am totally new to packet radio, and am experimenting with Flexnet. I have not yet been able to find anyone in my area who is into packet, so I am kindof on my own so far.

I am using flexnet with the sound card drivers. I have only connected for receiving right now, but it is not working. Though there is packet traffic on the radio, when I run bct, with "monitor on" no packets ever show.

When I run smdiag, nothing shows on the display unless I have option 4 "show trace only when dcd on" turned OFF. With this off, I see the signal on the display, and it is 2/3 scale. As soon as I turn this option on, the signal disappears.

Does anyone know what would cause this?

Thanks,

73 de KS4DX
Doug

Can someone PLEASE explain to me if using Pactor
or 2M packet is like using Internet email or
newsgroups in that it is done in virtual time
rather than real time?

IOW.... can one write messages offline, use Pactor
or 2M packet to send and get messages, and reply
when it's _convenient for one to reply (and
offline)??

OR.... is ham radio digital comms more like using
ICQ on the Net where BOTH parties must be online
at the SAME time to communicate??

All the programs I have seen allow for offline messaging. I beleive Airmail
is the same. You create your e-mail offline then the program connects and
uploads/downloads then logs off. Some of this may be manually done, such as
connecting to the BBS, logging on/off.

Some of you guys that go back to the Commodore128. Dust off your
recollections. Were you able to use the kam+ (plus) with the
original KAN64 and/or KAN128 softwear that was written by Kantronics?
I have been told that actually almost any "term" program will drive
into the KAM plus okay and get the job done. Guess this means I
can use the Kan128 softwear or choose a Commodore Term program like
"dialogue" and it should work??? Any confirmation or suggestions
welcomed.

You can use any ASCII terminal program, provided it has some special characters (control codes, vertical bar, tilde (~) and maybe some others I'm forgetting). You DO however, have to read the book to do it this way.

I'd recommend an infra-red solution, rather than RF.

Look into the new IrDA specs (do a web search) and look for IrDA devices.
No license will be required.

You can probably build your own devices by going to Radio Shack (or
similar) and hooking up an infra-red LED to a serial port via a buffer
amplifier, and doing the same on the other side with an infra-red
detector. If needed, a very cheap telescope or binoculars will make a
very high gain antenna.

Hello,
I have for sale the following items. They were purchased on 11/97, used very little:

IC-W32A.......Dual bander HT. Modified to receive and Transmit out of band.
IC-LC128...Carrying case.
IC-BC119...Desk charger.
IC-AD51.....Battery Adapter.
IC-BP171...4.8V 700Ma Battery
IC-HM75A..Speaker Mic

Everything is in excellent condition. ALL includes boxes and receipts! The HT also comes with another battery pack...so there is the low power and high power battery packs.

Asking $450 for everything...and I will ship first class insured.

Thanks..
Art

The AX.25 protocol specs can be found on the TAPR web site at
http://www.tapr.org/tapr/html/ax25.html.

For a good example of the implementation take a look at the Linux kernel code.

No. But you will have to build everything.

>My "allowance" is that data rates can be REALLY REALLY
>low (around 10bps - YES ten bits per second).
>Everything I have seen seems to tout high speed
>data transfer performance. I do not need it or want it.
>I want cheap and easy to use and install,
>and can live with low data rates.

Buy one of those simple crystal controlled FM transmitters
and tone modulate it (AFSK). And do the reverse on the
receive side. With a slow data rate, you can decode the
tones with a simple active filter using an op amp.

Check the circuit books at a local community college or
University library. Your city library probably isn't equipped
for electronics (most aren't). There are many many
examples of what you want.

Actually, both. One can use packet, pactor, amtor (etc.) to access a radio BBS system and drop a message to another amateur, or can use the same technology to converse in real-time.

For years, while I was a radio operator on an oil tanker at sea, I would send messages back to my friends and family (amateurs) via the APLINK system (Amtor-Packet-Link, which allowed a user on HF Amtor or Pactor to send messages to packet users on VHF through repeated forwarding). This worked out great when I was out of direct range with my friends, or our schedules didn't match up. I was also fortunate enough to have many real-time chats using packet radio, keyboard to keyboard.

Hope that answers your questions. Good luck!

2210 would give you the standard tones at a given carrier freq, but you don't have to use standard tones. The other station won't know the difference. If you use a center freq a kHz lower, asuming USB, the other guy using standard tones will be using a carrier freq 1 kHz lower and neither one of you will be the wiser until you compare freqs.

Let's say your freq readout says 14080. That is of course the freq of your supressedcarrier. You use 2210 Hz center freq, and your SPACE tone is 2195 Hz and your MARK tone is 2295 Hz. Looking at it from an RF perspective, there is an on/off modulated carrier from your station at 14082.21 kHz, and another one, 0.0170 kHz above it, at 14082.95 kHz. You achieve exactly the same thing with a 14081 kHz suppressed carrier freq, a kHz higher, and tones a kHz lower. The only thing "visible" to the other station is shift and actual frequency of the MARK or SPACE on the air, which by themselves each appear as an OOK carrier.

There are pros and cons fo different tone freqs. I have IF shift on my main rig, and so I can "move" my 500 Hz filter up around the tone freqs for RX, and rely on my rig's mic audio chain to suppress harmonics generated by the computer. Without IF shift, if you have a choceof filters, you can only use your narrow filter if you use tones included in the passband. In other words, you have a 500 Hz filter centered at 800 Hz. You must use a centeer freq of 800 Hz, +/- 100 or so or you can't use the filter.

Very low tones, around 700 Hz, allow easier implementation of op amp filtering of both received audio and AFSK TX tones. Q, bandwidth, and center frequency are inter-related. For a given Q, a narrower passband is attainable at a lower center freq. Or vice versa. A filter that only requires one stage at 700 Hz might need two at 2 kHz.

Many hams persist in using the standard tones only because many TNCs use them. I did, until I was convinced that was a piss-poor reason. I use the high tones now only to help with audio harmonic suppression.

The only thing confusing about everybody using different tones for AFSK is that when a station suggests a freq for a sked, depending on sideband used, and tone freqs, the two stations may find themselves looking for each other 4 kHz or

more apart. I think the standard for exchange of frequency information on RTTY and other 170 Hz shift digimodes should be the zero-beat RF frequency of the center freq... in other words the midpoint between the zero-beat freqs of the MARK and SPACE signals over the air. Then each station simply adds or subtracts as appropriate to the freq on his dial, and inverts the tones as needed. Won't happen in THIS lifetime, tho...

Yes... thank you!

I am trying to decide what mode and band to get
into dig radio with.

Should I use VHF and 2M packet..... or go with HF
and Pactor.... what?

I do NOT want to talk in real time. Instead.... I
want to communicate in virtual time just like me
and you are doing on this newsgroup.

What mode (2M packet, Pactor, etc) is best for
this? Also.... where is the BULK of people at on
dig comms..... VHF or HF? I don't wanna buy a
bunch of equip only to find out that there are
MORE dig comms on some other band.

I already have a Yaesu 50r. That is my ONLY rig.
So I can get into 2M packet cheap. But if there
is more "ragchewing" on HF (in the digital sense)
then I'll go with HF stuff. Again... I do NOT want
to talk in real time.

One other important thing.... I not only want to
send radio emial to other hams.... but also to my
family members on the Internet.

I am general class ham.... but have been out of it
MANY years.... so am definitely not up on all
these issues. <G> Any advice will be very
appreciated!

G-Tor is similar to Pactor. Under good signal conditions it switches to
a higher data rate. The G-Tor protocol belongs to Kantronics so at
present you'll only be able to link to other KAM's in the G-Tor mode.

Any "dumb" terminal program should work with the KAM so long as you can
set the baud rate, parity, and stop bits to match the KAM's serial port.
The specialized terminal programs permit you to control the KAM by
selecting items from a menu in the terminal - a little more convient.
With a "dumb" terminal you'll just type the various commands. This is
kind of like the use of DOS vs. Windows. By "dumb" terminal I mean one
where whatever you type on the keyboard is sent to the KAM and whatever
is sent to the computer by the KAM is displayed on the screen.

Just for interest, we use a full duplex, point to point, 10Mbps ethernet microwave link at work. It runs in the 23Ghz band, and up to 10 Km (limited by ethernet timing limits).

Inside it has a gunn diode for the transmitter, which is FM modulated by the diode voltage (really simple circuit!). No special modulation as far as I can tell (just takes up lots of bandwidth!).

Another gunn diode acts as the Rx local oscillator, and is mixed down to an IF at 144 Mhz !!! (did a ham design this?). The IF runs down coax to a control box which has the IF FM demodulator in it.

The RX frequency is 1.2 Ghz away from the TX freq, so it has a few isolators and filters to run both on the same dish.

All the Gunn diodes are free running (ie no frequency control, just a little AFC in the IF), although the RX LO is temperature controlled by a heater.

Pretty simple really. Now if only we could find some surplus microwave gear that would tune to an amateur band......

Hi,

I think your friend has a grounding problem. Make sure that the metal shield on the acc plug makes an electrical connection with the metal shield of the DIN plug going into the KAM+. Also make sure that the cable itself is shielded. Ideally the cable shield should be connected to the metal shield of both plugs on each end. Finally make sure the radio and the KAM are both grounded.

Hope this helps,

Philip

I posted that I had a problem with the Pk 232 soem time ago, but I contacted John Douglas of Timewave and he helped me overcome the difficulties with my computer .The 232 unit is now running fine on Windows 95 with the AEA PC Pak Ratt software. So, I guess I can't use the 232 for a sea anchor as I once considered. This is just a note saying that says Timewave is helping people who are having difficulties with their units. Dan, N6FPE

GTor seems to be sufficiently publicly documented. I've implemented it
some time ago in my Linux HF protocol stack
(http://www.ife.ee.ethz.ch/~sailer/ham/linux/hf.html). It links with
itself,
but I haven't tested against a Kantronics implementation due to lack
of a KAM (and lack of signals on the band :-))

From the description, I guess that it requires a very clean path
between the antennas (no obstacles within the first Fresnel zone). The
problem with simple FM/PM based systems is that it is quite sensitive
to multipath, so you really need a clean path with highly directional
antennas.

An FM-ATV signal has a similar baseband bandwidth and try to display a
picture with fine details (such as small text) when the path is
non-ideal (e.g. moving objects, such as cars, within the Fresnel zone
or even indirect paths).

In amateur use, finding clean paths can be quite hard, when the ham
density is quite low. A modified ATV repeater located at a high place
might be useful for creating clean paths.

To use indirect paths at any reasonable distances, a bit power is
required than is available from a Gunn diode and a more advanced
modulation method is required to combat the multipath.

2662. CMOS Super Keyer III problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-11 00:00:00 UTC
From: artky1k@northlandlink.com
Message-ID: <357fee66.513108@news.tds.net>
Source record: 23640

Hi Everyone,

I've recommended the CMOS Super Keyer III to many of you, and more than a
few of you has built it and use it daily. I love mine, there is nothing
else that even comes close to it!

I wanted to move mine to a smaller enclosure and increase the portability
after having found a source of SSSMMMAAAALLLLL 50 k pots and a piezo buzzer
that is less than .5 inch diameter and 3/8 inch deep.

I built the unit in a small box and will mount that box on my bencher
paddle after relocating the post that holds the return spring.

By using these small components, and some sub mini pushbutton switches, I
have reduced the current drawn from 40 ma to 8 ma and the entire assy
(except batteries) fits in a box that is 1.75" by 2.625" by 3/4".

The problem came when attempting to use the piezo buzzer however! The chip
is set up to drive a speaker with 500 to 990 hz user selectable square
waves. This makes a wonderfully nice sounding monitor, but small speakers
are not available.

If the user is willing to settle for a 3.3 hz fixed tone, the piezo buzzers
provide more than room filling volume (much louder than the speaker was),
and they draw 8 times less current than the speaker. The piezo buzzer is
the key to making the circuit small and portable--using the piezo buzzer
instead of the speaker even allows smaller batteries to be used because the
peak current drawn is much less!

I've operated cw exclusively for the past 26 years, and I've never been
hindered by the fact that the monitor sidetone was not 700 hz! My original
CMOS Super Keyer used a piezo buzzer @ 2.9 khz. While a 700 hz tone

might
be nice, it should be an option for those who elect to use a speaker,
NOT
MANDATORY. I'd rather have the OPTION for a piezo buzzer.

There are at least 10 available IO ports on the motorola chip used in
the
super keyer III, but none of them has a logic output suitable for
driving
the piezo buzzer!

I called one of the authors of the firmware for the super keyer III
and he
confirmed that an output suitable for driving a piezo buzzer is not
available. There is no firmware command for converting the existing
speaker
output to a piezo buzzer capable output either!

Needless to say, a 3.3 khz buzzer driven by a 700 hz square wave
SOUNDS
LIKE (expletive deleted).

A one shot monostable vibrator could be added to lengthen out the 700
hz
pulses, or an rc circuit could be used. I find it very disturbing that
such
a fine keyer is lacking this option!

The author of the firmware was very nice and I demonstrated the piezo
buzzer over the phone. But, he advised that he doesn't own the
software and
that he was only paid to write it and that he has no other interest in
the
project. He is unable to modify the software and provide an updated
chip, I
even offered to PAY him to do this for me. He also advised me that
Idiom
Press is owned by a businessman (non-ham?), and that an appeal to them
would be unsuccessful. Ever notice that ads for the Super Keyer DO NOT
list
a phone number for Idiom Press?

Does anyone have any suggestions regarding this problem?

Personally, I'd like to see a surface mount version with more
features. The
piezo buzzer and the volume control would be pc board mounted! Both
chips
used in the super keyer III are available in smt packages and the
entire
circuit (including pot, piezo buzzer and memory channel switches could
easily fit on a 1.5 inch by 2 inch pcb)!

Does anyone have any pull with Idiom Press?

GL

I used a piezo transducer (not a buzzer) driven by the speaker output. I found one that had a low frequency capability to 1000 Hz which worked okay for 700 Hz and could be driven directly from the output of the IC so I was able to eliminate the transistor drive circuit from the keyer. Radio Shack has a few types and DigiKey has a fairly good selection.

Hello!

I have connected my FT747GX to the web.
The solution is a java applet and a real audio server, providing both tuning controls and live audio.
The FT747GX can be digitally tuned between 100 kc and 30 Mc in 100 kc steps.

Geographical location is 15 kms south of Stockholm City, Sweden. Aerial: dipole.

Welcome to http://hightech.lindman.com

Best Regards

Mr. K. Lindman

NOS gurus:

Has any body hacked a version of NOS to a web browser like Netscape (or maybe some other, older one like Mosaic)? We're experimenting with with some
high-speed NOS (19.2 kbps) at UHF (with a KPC-9612) and would like to demo the setup with a web browser as an application riding on the NOS. (Currently JNOS in our case).

Similar question: anybody got a commercial mail client like Eudora to run on the same computer as a NOS server/router so as to produce a stand-alone mail system? (I.e., Eudora replaces say BM.)

Tnx Ken KB1JY kwick@mitre.org

PC-VFO is the DDS RF Signal Generator Card for your PC.

This DC-54 MHz DDS Signal Generator operates from an ISA port in virtually any PC. Because of its architecture, it can operate at unprecidented speed compared to serial or parallel port external models or PIC conrolled standalone units. And, because we supply all the source code for the applications supplied with PC-VFO (DOS & Windows) alongh with detailed programmig instructions, you can write your own custom test sequences or operating software.

ByteMark is proud to announce that RT SYSTEMS of Hunsville, Alabama, will be carrying the PC-VFO and will have them available at the hamfests they attend. Go to http://www.rtsars.com and find out when RT-SYSTEMS will be at a hamfest near you. Stop by and see them, and pick up a new PC-VFO!

You can call RT SYSTEMS Toll-Free at 1 800 723-9292 Tell them you got the number from this newsgroup post!

Our radio shop has under gone a few changes and is updateing some of
the shops test equipment. We have the following test equipment for sale.

(1) Tekronics 150 MHz 4 channel scope Model 2445A,
asking price is $1,700 in Canadian funds or $1,100
in US funds.

(2) IFR service monitor model 1000, asking $2,000 in
Canadian funds or $1,250 in US funds.

(3) Marconi automatic distortion analyzer, this is only 2 years old
and I think we paid about $3,000 for this unit. Asking $950.00
in Canadian funds.

All the equipment listed are in very good working order, and clean and
look good, as all this equipment has been cared for and maintained.

What about the Petition of Right in 1628 and the Bill of Rights in
1689? After reading these two documents, I am convinced that the
American Revolutionists used their phrasology and influence when
writing our own Constitution and Bill of Rights. These two English
documents make very interesting reading if you like history, as I do.

Oh, yea...how much for the Magna Carta?? :)

Hi All,
Here is an article that I put out onto the local Packet Network and have
readdressed it to @ DCC after interest was shown by some of the DCC committee
on my proposed plans for using 10Ghz. This article was written a number of
weeks ago and my plans have further developed since then.

73, Pete G6KUI

HIGH SPEED DATA LINKS ON 10 GHZ.
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

When I first got started in Packet , one of my aims was to develop a system that would allow me to exchange files with others in a reasonable time period. My idea was to send and receive pictures that were exact reproductions. Before getting into Packet, my interest had been Fast-Scan-TV where pictures were sent and received instantaniously and then digitised at the received end. How much better it would be to digitise at the transmit end, thus preserving all the detail, and send it by Packet. This worked very well but proved to be very SLOW often waiting an hour or more to transfer a 50K GIF file on a busy 1200 baud two metre frequency that was shared by many others. A far cry from INSTANT pictures!

I started looking around for TNCs etc that would allow me to vastly increase the data transfer rate. I settled on the Baycom USCC card that had two slow, 1200bd, ports and one faster port that was configurable from 2400 bits-per-sec upto a respectable 38,400 bits-per-sec. I purchased the USCC board as a kit and built it up. I then got sidetracked into running a multiport node, sadly all ports were only running 1200 baud. To add to the complication of trying Fast-Packet, there was no-one locally with either the wish or the capability of this facility. I had radios converted to give me 9600baud capability on 6metres, 2 metres, 70cm and 23cm. Still no takers locally - Playing by oneself is not much fun !

Interest was starting to be shown in Packet at my local radio club (Nunsfield House in Alvaston, Derby) and it was decided to set up a packet station. We decided to build a Baycom USCC card, but this time not from a kit but to source all the bits apart from the board, GALS, and EPROM. Guess who got the job of doing all the donkey work ? - yes me. Finally the card was completed, tested and it WORKED - well it did in my computer but not the clubs ! After much swapping and changing of motherboards etc, it finally was made to work at the club.

I now had two systems under my control with High-speed-Packet capability. But what about the radio side ?

As Nunsfield House is only about a mile away and is line-of-site (hopefully) from my QTH, the thought of 10GHz came to mind. I had played with 10GHz for TV and phone and results had been ok and the equipment is CHEAP and readily available.

THE RADIO EQUIPMENT
~~~~~~~~~~~~~~~~~~

On the transmit side, a Gunn-Diode oscilator, these are readily available on the surplus market and are easily tunable over the whole of the 3cm band. The price of these modules is about 10 pounds. Tuning is made by turning a single set-screw, nothing could be simpler. Apart from that a simple circuit board is easily constructed in an hour. Boards intended for ATV use are available for 20 pounds. The only other item is the antenna, either small horns or 'satellite' dishes. The gunn-diode produces about 10mW of RF at 10GHz and with antenna gain brings this figure up to 100 watts ERP with a 4ft dish - this is more than is allowed for unattended operation. I intend to use small horns with gains of about 15 - 20dB.

On the receive side the best way is a converted satellite LNB. Nomally these have a local oscillator running at 10,000 MHz. These are easily adjusted down
~~~~~~~~~~~~~~~~~~

to 9,000 MHz. The only other thing needed is a standard satellite receiver. The LNBs can be obtained ready converted, they have a noise figure of about 1.3 dB and some phenominal gain ! Again an antenna system consists of either a horn or dish. Combined receiver gains of 80+dB are readily obtainable.

THE 10GHz (3cm.) BAND
~~~~~~~~~~~~~~~~~~~~

The 10GHz band is from 10,000 MHz upto 10,500 MHz - this is a vast 500MHz to play in. Most of it can be operated unattended (subject to informing RIS). The unattended portions are 10,000 - 10,250
10,270 - 10,300
10,400 - 10,500
This is more than enough room for anyone, plenty of bandwidth to spare.

DATA TRANFER RATES
~~~~~~~~~~~~~~~~~~
As all the radio equipment is wide-band and is currently designed/utilised for fast-scan TV that has a bandwidth requirement of about 30MHz, I can't see any problems of using it for relatively slow packet data.
Using a 38k4 full duplex system, a 50k file should transfer in about 10-15secs. This is somewhat faster than slowscan but the quality will be perfect. It sure beats the present 1200baud half-duplex system that everyone in this area has gone for at present.

I hope to finish the constructional side of things in the near future (I have already purchased everything for the two ends of the link) and hope to be doing on-air tests later in the year when the weather is warmer.

73, Pete G6KUI (ALVAST Node in Derby)

It's 11 Jun 98 21:29,
We'll return to keinanen@sci.fi and All's
discussion of T1 digital, is anyone doing it, or is everyone playing with toys

ke> From the description, I guess that it requires a very clean path
ke> between the antennas (no obstacles within the first Fresnel zone). The
ke> problem with simple FM/PM based systems is that it is quite sensitive
ke> to multipath, so you really need a clean path with highly directional
ke> antennas.

Path issues would be important.

ke> In amateur use, finding clean paths can be quite hard, when the ham
ke> density is quite low. A modified ATV repeater located at a high place
ke> might be useful for creating clean paths.

ke> To use indirect paths at any reasonable distances, a bit power is
ke> required than is available from a Gunn diode and a more advanced
ke> modulation method is required to combat the multipath.

I have thought about the idea of using the networking capabilities of
digital modes to advantage. In other words, using microwave at high
speed to form a backbone between mountain tops, and linking that to
lower frequency (in the 70cm or 23 cm bands, say, maybe even the
standard 1200 etc at 2m) for user access. In a sense, a bit like hoe
the Internet turned out, very high speed backbone, with most users
dialing in at 33.6 or slower.

... 87.49765% of statistics aren't as accurate as you think.

> Any idea who makes this equipment and where it is sold?

Jay, about the only solution I've seen over the past few years is to go
surplus. At the dayton hamvention I picked up a pair of Aironet ARLAN
cards for $100 - and there was five more pairs at the same price!
Basicly they 2.4 GIG spread spectrum ISA network cards. The specs rate
them for 100mw output. Currently I have them working accross the house
in diagnostics mode - I just have to read the manual (to set them up)
then pop them in linux boxes. The link I'm going to try for is about 1km
non LOS. I suspect with small yagi's (10 - 15 elements I would easily be
able to do the 10km. Oh yeah, the speed happens to 2 megabits as well.

I'd be interested in talking to other people using the aironet cards...

You can do packet on one side while operating the other just as you say. If this is the same band, you will have to "multiplex" transmissions, i.e. can't transmit on 2 meters on both sides at the same time.

the packet port requires the kenwood cable. They supply the interface data with it.

Date: 1998-06-14 00:00:00 UTC
From: Rick Pemble <pemble@ix.netcom.com>
Message-ID: <6m1roc$flq@sjx-ixn6.ix.netcom.com>
Source record: 23582
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

You can do packet on one side while operating the other just as you say. If this is the same band, you will have to "multiplex" transmissions, i.e. can't transmit on 2 meters on both sides at the same time.

the packet port requires the kenwood cable. They supply the interface data with it.

pin 1: TX Audio
pin 2: Gnd
pin 3: PTT
pin 4: RX Audio 9600 Baud
pin 5: RX Audio 1200 Baud
pin 6: Squelch
E: shield

hard to describe pinnout, looking at the connector:

bottom left pin 1
botton right pin 2
middle left pin 3
middle right pin 4
upper left pin 5
upper right pin 6

cheers
Rick W4RP

Here I thought rec.radio.amateur.policy was created for discussion
of the morse code issue..... so why am I seeing this garbage in
rec.radio.amateur.digital.misc? We have enough arguments
(such as the LL Lid issue) without you loonies cross-posting
your nonsense over here.

I used to read rec.radio.amateur.policy but gave up after I realized
that the same people have been carrying on the same argument
for YEARS. You guys really need to get a life!

Source record: 23585

Hi Folk

I am a newbie to digital modes. G4ZKJ has mentioned to me that the HamComm 3.1 I set up on his Pentium 150 will only show RTTY and AMTOR text correctly if he has the incoming text covered up by the HELP screen.

ie. He gets garbage until he puts up the help screen. Then, when he quits the help mode, the text that landed behind it is OK.

I truly believe that if Z4ZKJ says it happened, it did.

Er .. HELP!

2697. BTL and HamCom Questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-14 00:00:00 UTC
From: Joe Hutcheson <jchutch@ma.ultranet.com>
Message-ID: <6lvn87$fu6$1@ligarius.ultra.net>
Source record: 23667

I have been a ham for nearly 31 years, but only recently discovered the existence of software that can be used for RTTY, AMTOR, etc. (Actually, I was inactive for a number of years, and started reading QST recently, where I found out about HamCom).

Two problems:

Using BTL with a SoundBlaster compat. card, I found that simply plugging in the cable from my XCVR (Icom IC-730) caused the program to start to read gibberish -- even if I turned off the xcvr! When receiving, the "virtual" meters appear to correspond to audio from the XCVR, so my guess is that somehow the audio cable is picking up noise -- but not from the xcvr (since this happens even if the xcvr is off). I was careful to try BTL in DOS, not just a DOS-emulating Win 95 box. Any ideas on causes or solutions?

2. HamCom seems really exciting as a solution, but I have one problem here, too. My landline modem is an internal add-in card in my Pentium machine, and my mouse is on the other serial modem. Do I run HamCom without the mouse, or is there a way to add additional serial ports? My computer has a PS2 mouse input, but I assume that would still tie up the com port anyhow.

Suggestions?

Thanks.

Joe

Check for a shorted final (replace the finals with different tubes).
If that does not cure the problem, you may have a more grave situation
(like I did) when the MAIN POWER TRANSFORMER developed a short. Last
time I checked, a new one cost around $150.00

73 and good luck...
Joe

Hello. I wonder if anyone would care to share some thoughts on the use
of the TM-V7A and packet radio? I own one of the "cool blue" radios but
have so far only used it for voice. I believe the manual said something
about being able to use packet AND voice at the same time....exactly what
do they
mean by that? Do they mean you can use packet on the 2-meter side while
using voice on 440 on the other side? Anyone done that? Any hints on cabling
or anything else anyone might like to report is greatly appreciated. Thanks!

There is usally another physical comport assocated with the modem card. If
so its usally com 3. Try to assign the hamcomm circuit to that port. if
not the suggestion of the ps2 mouse sounds like a real winner.

What is totally amazing is the membership of NCI allows things like
what you show on your web page to happen in their organization. I guess
that is what you get when a bunch of people trade their morality for a
free HF handout.

Actually MD I have no problem with being a member of NCI and I have actively recruited several new members recently and they are well pleased with the organization. Steves' website is probably a good place to refer potential members too as an example of what kind of prestigious is out there regarding the new Amateurs entering the ARS today and why NCI is working hard to be representative of all Amateurs in the ARS today and not just a few license

classes. Do I worry about my membership in NCI, no I don't because too many people like you and Steve seem to be doing the worrying for me.

Mike ... NOTHING of what Jim shows (in most cases, COMPLETELY
out of context) "happened within NCI" ...

Your (and Jim's and Steve's) lame attempts to "connect" my personal
arguments with rabid procoders such as yourself to NCI are absurd
and totally baseless and you know it ...

You are simsply playing the old political game of muck-raking
in hopes that some can be duped by your tactics, plain and simple.

> I guess
> that is what you get when a bunch of people trade their morality for
a
> free HF handout.

Your characterization of the members of NCI in the sentence above is
SURE to enamour you to them ... keep up the good work.

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

2713. 2nd Straw Poll: rec.radio.amateur.* reorg

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-15 00:00:00 UTC
From: Jeremy Billones <billones@primenet.com>
Message-ID: <6m30bvefn1@clarknet.clark.net>
Source record: 23591
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx

(Repost. Crossposted to fewer groups, multiple times.)

LAST CALL FOR VOTES (of 2)

Votes must be received by 23:59:59 UTC, 22 Jun 1998.

This vote is being conducted by a neutral third party. Questions
about the straw poll should be directed to the rec.radio.amateur.*
Working Group at <rra-wg@theporch.com>

Votetaker: Jeremy Billones <billones@primenet.com>

STRAW POLL Q & A

Q: Who is doing this?
Q: How may I join the rra-wg?
Q: Why are we doing this?
Q: What are we doing?
Q: More to the point, why are we "kicking over this hornet's nest?"
Q: Why do you want to change the newsgroups again?
Q: Who are you to tell us what to do with "our" newsgroup?
Q: How long ago were each of the rec.radio.amateur.* newsgroups created?
Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and
rec.radio.swap included in this opinion poll?
Q: Where can I obtain a copy of the original newsgroup charters?
Q: Where can I find out more information about the Usenet RFD/CFV
process?
Q: I don't want any of the newsgroups to change. What should I do?
Q: I want to go back to one single newsgroup for amateur radio on
Usenet, like we had back in the 1980's. What should I do?
Q: I support some of the newsgroups for amateur radio, but not others.
What should I do?
Q: I support the existence of a newsgroup, but disagree with its
charter. How should I vote?
Q: I would like new newsgroups to be created, what should I do?
Q: I have no opinion, what should I do?

Q: Who is doing this?

The rec.radio.amateur.* Working Group (rra-wg@theporch.com, which
initiated the last major reorganization in 1993) is the point-of-contact
for questions about this opinion poll. Principal members are Paul
W. Schleck, K3FU, and Jeffrey Herman, KH2PZ. Though not an rra-wg
member, Gary Coffman, KE4ZV, also endorses this opinion poll. this
opinion poll will be conducted by an unbiased third party from the
Usenet Volunteer Votetakers (UVV), Jeremy Billones

(billones@primenet.com).

Q: How may I join the rra-wg?

Anyone who volunteers may join the rra-wg. The rra-wg has always solicited volunteers from when it was created in 1993 (originally named rra-reorg) to draft an RFD to reorganize the rec.radio.amateur.* newsgroups (and continues to serve as an advisory group for FAQ maintainers and new newsgroup proponents). You may join the rra-wg by subscribing to its mailing list.

The automated list manager address is

listproc@theporch.com

Use this for subscribing, unsubscribing, getting archived info, getting the FAQ message, changing your address, etc.

To subscribe, send a message to this address with "subscribe rra-wg <your name>" Similarly, to unsubscribe, replace "subscribe" with "unsubscribe"

The list owner address is

listown@jackatak.theporch.com

Use this address only when there is a problem which really truly can't be resolved otherwise.

Q: Why are we doing this?

Discussion on the rec.radio.amateur.* newsgroups shows that there is a difference of opinion about the current newsgroups and their charters. Assertions on one side of the argument that the charters were voted upon by the readers have been countered with assertions on the other side that the votes took place years ago, by a very small minority of the current readership. There is also the strongly-held opinion among some that we have "too many newsgroups." The following is a sample posting from the discussion thread on rec.radio.amateur.misc that led to this opinion poll (the entire thread may be viewed at DejaNews, http://www.dejanews.com/):

Q: What are we doing?

As a preliminary (and perhaps even diverting) step to an RFD (which would be very laborious and time-consuming, and perhaps unnecessary), we will conduct a Straw Poll, or "Vote of Confidence" (similar to the vote of confidence for a Prime Minister made by British Parliament, or a non-binding resolution of the U.S. Congress). We do it Usenet-vote style (utilizing a neutral vote-taker from the UVV). During the poll, a vote is taken where a "Vote of Confidence" yeah or nay for each newsgroup, as currently constituted and chartered, is given by each voter (YES/NO/CANCEL/ABSTAIN votes are valid).

What votes mean:

YES: I support the existence of this newsgroup and its charter

NO: I disagree with this newsgroup's charter or I believe that this newsgroup's existence should be reconsidered in a future RFD/CFV

CANCEL: Delete any previous votes I made concerning this newsgroup

ABSTAIN: I have no opinion concerning this newsgroup

Each newsgroup that does not pass a vote of confidence by Usenet voting standards (2/3 and 100 vote majority of YES versus NO votes) may be referred to the Usenet newsgroup creation process where their deletion or modification (based on a rough consensus of the preceding 30 days of discussion and how much they lost in the vote of confidence) is proposed. Each newsgroup that does pass a vote of confidence will have its charter, and justification for existence, reinforced to the

readership (as the current readership voted on it).

Q: More to the point, why are we "kicking over this hornet's nest?"

Sometimes hornet's nests can get big enough that they wind up falling down anyway. As shown in the thread above, there are significant undercurrents of disagreement over the current newsgroups, their charters, and even the suggested guidelines and rules of net-etiquette that many on the newsgroups advocate. If this opinion poll shows strong agreement with current practices, then that would help reduce (though not eliminate) newsgroup arguments on the subject. If, however, this opinion poll shows strong disagreement, then it's probably better that we know that right away, and take steps to fix the current situation before it degrades any further.

Q: Why do you want to change the newsgroups again?

Only some of the proponents of this opinion poll wish to change the newsgroups. Some wish to simply have the current newsgroups and their charters reinforced. All of the proponents agree that an up-to-date opinion poll of the readership is desirable at this time. Whatever future actions will be taken will be determined by the results of this opinion poll.

Q: Who are you to tell us what to do with "our" newsgroup?

One answer is that on Usenet, no one "owns" an unmoderated newsgroup. Newsgroups are voted into existence by a democratic process to determine consensus (and lack of significant objection) for using shared network resources to support them. All of the existing rec.radio.amateur.* newsgroups passed such a vote at some time in the past, and should pass such a vote again if there is strong support for their continued existence.

Another answer is that this is just a non-binding opinion poll of the readership to determine a consensus, if any, for making changes. It would still be necessary to undertake a formal RFD/CFV process to change any Usenet newsgroup (and that was always possible, anyway).

It should also be emphasized here that no individual rec.radio.amateur.* newsgroup is being singled out. Rather, a consensus of the readership concerning ALL rec.radio.amateur.* newsgroups is being sought.

Q: How long ago were each of the rec.radio.amateur.* newsgroups created?

1972 (or possibly earlier, this date is when UCSD joined the ARPANet):

Info-Hams (original ARPANet mailing list at Simtel-20, continues today at UCSD as a gateway of rec.radio.amateur.misc)

1979:

Creation of Usenet News at Duke and UNC

early 1980's:

fa.info-hams (fa = "From ARPANet") *
net.ham-radio (pre-Kent Paul Dolan "Great Renaming") *

mid 1980's-1991:

rec.ham-radio *
rec.ham-radio.packet *
rec.ham-radio.swap *

1991 Reorganization:

rec.radio.amateur.misc
rec.radio.amateur.packet *
rec.radio.amateur.policy
rec.radio.cb
rec.radio.swap

1992/3 Addition:

rec.radio.info

1993 Reorganization:

rec.radio.amateur.antenna
rec.radio.amateur.digital.misc
rec.radio.amateur.equipment
rec.radio.amateur.homebrew
rec.radio.amateur.misc
rec.radio.amateur.policy
rec.radio.amateur.space

1996 Additions:

rec.radio.amateur.dx
rec.radio.amateur.boatanchors

* = obsolete

Current newsgroups covered by this opinion poll, and the years
in which they were created:

rec.radio.amateur.antenna (1993)
rec.radio.amateur.boatanchors (1996)
rec.radio.amateur.digital.misc (1993)
rec.radio.amateur.dx (1996)
rec.radio.amateur.equipment (1993)
rec.radio.amateur.homebrew (1993)
rec.radio.amateur.misc (1991)
rec.radio.amateur.policy (1991)
rec.radio.amateur.space (1993)
rec.radio.info (1992/3)
rec.radio.swap (1991)

Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and
rec.radio.swap included in this opinion poll?

Though one level up in the rec.* hierarchy, these newsgroups are
principally used by readers of rec.radio.amateur.*, and their fates
would substantially be decided by any significant reorganization of the
rec.radio.amateur.* newsgroups. Though created by a rec.radio.amateur.*
reorganization, rec.radio.cb is not included in this opinion poll.

This announcement has been cross-posted to all rec.radio.* newsgroups
(except for rec.radio.broadcasting and rec.radio.info, which are
moderated). In addition, the following individuals were consulted prior
to this announcement (note that consultation does not necessarily
imply endorsement):

Richard Eckman, KO4MR, Proponent of rec.radio.amateur.dx
Brian Kantor, WB6CYT, Administrator of Info-Hams/Ham-* mailing list
gateways of rec.radio.amateur.* newsgroups at UCSD
Ian Kluft, KO6YQ, Proponent of 1993 rec.radio.amateur.* reorganization,
former rec.radio.amateur.* FAQ Maintainer
Jay Maynard, K5ZC, Proponent of 1991 rec.radio.amateur.* reorganization
Brian Short, K7ON, Moderator of rec.radio.info
Rick Stealey, K2XT, Proponent of rec.radio.amateur.boatanchors

Q: Where can I obtain a copy of the original newsgroup charters?

ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.info
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur-reorg
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.dx
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.boatanchors

Q: Where can I find out more information about the Usenet RFD/CFV
process?

ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Create_a_New_Usenet_Newsgroup
ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Format_and_Submit_a_New_Group
_Proposal
ftp://rtfm.mit.edu/pub/usenet/news.groups/Guidelines_on_Usenet_Newsgroup_Names

Q: I don't want any of the newsgroups to change. What should I do?

Vote "YES" for all of the existing rec.radio.amateur.* newsgroups.

Q: I want to go back to one single newsgroup for amateur radio on
Usenet, like we had back in the 1980's. What should I do?

Vote "NO" for all (or all but one) of the newsgroups.

Q: I support some of the newsgroups for amateur radio, but not others.
What should I do?

Vote "YES" for any newsgroups that you wish to remain unchanged, and
vote "NO" for any newsgroup you wish to have reconsidered in a future
RFD/CFV.

Q: I support the existence of a newsgroup, but disagree with its
charter. How should I vote?

Since this opinion poll is for both the existence of given newsgroups
AND their current charters, you should vote "NO" for that newsgroup.
Again, this is a non-binding opinion poll simply to determine if current
newsgroups should be considered for modification or deletion, not a vote
to actually modify or delete these newsgroups.

Q: I would like new newsgroups to be created, what should I do?

Creation of new newsgroups is not being considered by opinion poll. A
future RFD/CFV would have to be initiated to do this. You are, of
course, welcome to express your opinions concerning new newsgroups by
posting them to rec.radio.amateur.misc (*NOT* by E-mail to the
vote-taker).

Q: I have no opinion, what should I do?

You may wish to read the preceding 30 days of public discussion on
rec.radio.amateur.misc about this opinion poll to develop your own
opinions (go to http://www.dejanews.com/ and search for "STRAW POLL").
If, after reading the public discussion, you still remain undecided, you
may abstain from this opinion poll. You may do so informally by not
participating in it at all, or formally by explicitly voting "ABSTAIN"
for all of the newsgroups.

IMPORTANT VOTING PROCEDURE NOTES:

Standard Guidelines for voting apply. One vote per person, one account
per voter. Votes must be mailed directly from the voter to the votetaker.
Anonymous, forwarded or proxy votes are not valid. Votes mailed by
WWW/HTML/CGI forms are considered to be anonymous votes.

Vote counting is automated. Failure to follow these directions may
mean that your vote does not get counted. If you do not receive an
acknowledgment of your vote within three days contact the votetaker
about the problem. It's your responsibility to make sure your vote
is registered correctly. Duplicate votes are resolved in favor of
the most recent valid vote. Addresses and votes of all voters will
be published in the final voting results post.

HOW TO VOTE:

Extract the ballot from the CFV by deleting everything before and after
the "BEGINNING OF BALLOT" and "END OF BALLOT" lines. Don't worry about
the spacing of the columns or any quote characters (">") that your
reply inserts. Please, DO NOT send the entire CFV back to me!

Fill in the ballot as shown below. Please provide your REAL NAME and
indicate your desired vote in the appropriate locations inside the ballot.

When finished, MAIL the ballot to: < voting@clark.net >
Just "replying" to this message should work, but check the "To:" line.

Examples of how to properly indicate your vote:

```
[ YES ] example.yes.vote
[ NO ] example.no.vote
[ ABSTAIN ] example.abstention
[ CANCEL ] example.cancellation

DO NOT modify, alter or delete any information in this ballot!
If you do, the voting software will probably reject your ballot.

If these instructions are unclear, please consult the Introduction to
Usenet Voting or the Usenet Voting FAQ at http://www.iki.fi/~jpatokal/uvv.

======== BEGINNING OF BALLOT: Delete everything before this line =======
.--------------------------------------------------------------------
| 1ST STRAW POLL: rec.radio.amateur.* reorg

2714. 6 meter packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-15 00:00:00 UTC
From: "Jim (N8XYN)" <jim.n8xyn@worldnet.att.net>
Message-ID: <6m340d$5bv@bgtnsc02.worldnet.att.net>
Source record: 23592
Cross-posted to: alt.ham-radio.packet,alt.radio.digital,rec.radio.amateur.digital.misc

Hi folks! The band has be VERY good lately. I'm hopeing for my first ever 6 meter packet DX connect. There are 2 stations in this area (Southwest, Ohio) running beacons on 50.620 Mhz FM (FSK 1200 Baud). Myself N8XYN and Scott (KC8GXR). I'll be beaming Southwest towards Texas. I'm running 125 watts into a 4 element quad, horizontal. Scott is running 100 watts into a vertical omni. Beacon from me every 90 seconds. Scott's beacon is every 5 mins. Will QSL all. Give it a try when the band opens up ifen you get the chance.

Sorry about the frequency. We are on "50.6mhz" not 50.8. There is no beacon
but I monitor for CQs and Rus will call CQ during openings. If you are on
during a band opening call RTTY CQ on 50.6mhz. If I or Rus is there we will
surly get back to you.

Um, Griff... it's considered rude to those with slow modem connnections
and/or per-hour connect charges to post a 90K jpeg along with what amounts
to a two-line message...

If using the mic. plug just 3 wire are used. gnd., ptt. and tx audio.
turn off the vox.
the manuals will list them, like 2,3,8 ?? I am not near the books.
Yaesu has a standard for them mic plug so any 8 pin wiring diagram
will work.

Attention HF Digital fans!

Do you know about Hellschreiber? A high performance mode designed long before its time - but its time is NOW! DSP and PCs have made operation simple and good fun - the performance is generally better than RTTY or AMTOR. Hellschreiber is a low resolution FAX text mode, generally transmitted as on/off keying, like CW, and occupies about 400 Hz bandwidth. The official designation is A2C. 2.5 characters per second are transmitted, and the rate does not slow down when conditions are bad. Its QRP and weak signal performance is excellent.

Here in ZL there are 4 stations QRV, looking for DX contacts. There are stations in VK and plenty in Europe. Best places to look are 14.061 MHz at 0200-0300z and at 1230z Saturday and Sunday, and 3.560 - 3.570 Mhz at 0800 - 0900 Wednesday to Friday.

For more info on Hellschreiber, see Ham Radio Magazine December 1979 or check out http://home.c2i.net/clank/ham/hell/hell.html.

The LA0BX software mentioned there works really well, and only requires a Hamcomm type interface and a 10 MHz PC of any sort - even an HP Palmtop will work! There is also high performance software for Motorola 56002 EVM DSP units which produces the ultimate in DX performance.

SEE you in Hell!

73, Murray ZL1BPU.

2722. FS: Two AEA PK90 TNCs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-17 00:00:00 UTC

Message-ID: <3586d7e1.0@news.iprolink.co.nz>
Source record: 23600
Cross-posted to: aus.radio.amateur.digital,rec.radio.amateur.digital,rec.radio.amateur.digital.misc

I have two PK90 1200 baud packet radio TNCs for sale. They are essentially unused, but are without power supply (12V) or packaging. I have ONE original manual. The units are fully operational.

These units are commercial grade (with extended temperature range operation, and a number of other improvements), provide a disconnect header and external connector for high speed modems , plus will utilize ENCRYPTION.

Obviously the encryption is not to be used on Amateur Bands.

I wish to sell these as a pair. Offers around the US$300 mark would be considered. The price would need to include the shipping cost.

I am also prepared to trade for a recent KAM, PTC-II or what-have-you in the digital line.

Murray ZL1BPU

If you want to do some good old-fashioned packet-internet gateway
hamming do the following:

1. point your browser to http://www.graphcomp.com/mutt/lite.html
2. download the latest version of Mutt Lite mutt_01k.zip
(72,393 bytes) or ftp from this site:
ftp://ftp.graphcomp.com/pub/msw/mutt/mutt_01k.zip
3 configure as follows:
character name Ottawa Converse
port address 134.117.12.18
port number 3600
4 log on usng /n yourcallsign 0
that is: slantsign n callsign zero
first command i usually do is /list

5 use the following command set to navigate:

Conversd Commands for TPP-1.14 at Hydra

The commands can be abbreviated by leaving out any non-capitalized
letters
in the command name. Parameters in "[]" are optional.

NOTE: Commands marked with "*" are only available to SYSOPs.

/? Prints a short summary of the available
commands
/Away [text] Mark user as being away

/ACtion text Write action to channel

/ALl text Send text to all users

/Beep Toggle Beep-Mode

/BELl Toggle Beep-Mode

/BYe Terminate the convers session

/Channel n Switch to channel n

/CHARset [in [out]] Change terminal emulation (default ansi)

/CQ [text] Sends a CQ to all users

/CStat Displays links and destinations information

/CUt Simulates the cutting of a card deck/displays
result
/Destinations List reachable ping-pong hosts

/Exit Terminate the convers session

/EXClude user text Send Text to all on channel except user

/HAlt Halt the convers server - operator-only
command
/Help [subj] Get help on a subject

/HOsts List reachable ping-pong hosts

/Invite user Invite user to join your channel

/IMsg user text Send Text to all on channel except user

/IWrite user text Send Text to all on channel except user

/Join Switch to channel n

/LAst user List last appearances of user

/LEave [channel] Leaves specified or default channel

/Links [args] List or setup links (see "help links")

/LISt List all channels and topics

/ME text Write action to channel

/MOde #channel options Set channel options

/Msg user|#channel text Send message to a user or joined channel

/News Prints out the current PingPong 'news'

/NIckname name Set the name you will be identified by

/NOnickname Reset nickname to your username

/NOTify [calls] Send notice if one of calls signs on

/NOTE [text] Set personal description

/Operator [number] Become operator

/Page user Page a user to join your channel

/PErsonal [text] Set personal description

/PRompt abcd Prompts a=query b=std c=ctrl-g d=ctrl-h

/QUEry [user] Start/End a private conversation

/QUOte Sends host's Quote-of-the-day to the current
channel
/Realname [user] List nicknames and realnames of users

/RESTart Restart the convers server - operator-only
command
/ROll Simulates the rolling of two dice/displays
selection
/Send user text Send a private message to user

/SMiley Displays a random 'smiley' and its meaning

/STats [[mode] [num]] Request statistics on this server

/SYsinfo [host] Requests information about a specific host
site
/SYSOp [number] Become operator

/Time Sends host's current time to the current
channel
/TOpic [#chan] [text] Set channel topic. Text=@ removes topic

/UPtime How long has this conversd been up ?

/Users [*|A|L|Q] List users and their channel numbers

/Verbose Toggles verbose Flag

/VERSion Show version information

/Who [*|A|L|Q|U users] List users and their channel numbers

/WHOIs [user] Gives complete information about a user

/WIdth [value] Set/show terminal width

/WRite user text Send a private message to user

>Can anyone help me out with finding a good internet-packet gatway?

I'm sorry, Jeff, but there very few "good" Packet/Internet gateways... Most of them are misused as a means to avoid using radios, and end up doing Amateur Packet Radio much more harm than good.

There's a really great one close to my location, but that wouldn't do you much good.
Your best bet is to ask the Hams who live in your area.

These days a Ham can use a soundcard for a TNC, so the only real expense is the radio. If you're not interested in owning a radio, why bother with a Ham ticket?

Prior to using Packet Radio for field day communications I would like to suggest you go to the ARRL Web site and read the field day rules at

http://www.arrl.org/contests/announcements/98/rules-fd.html

In general, packet this year carries no bonus and you can not use a digipeater of any kind except for satellite contacts.

ANY digital contact this year counts 2 points same as CW.

In the past, you have been able plug in to a local packet system and digipeat through a Packet cluster, Network or BBS and do a keyboard to keyboard connect through one of these networks. Not so this year.

Read the rules and then call the ARRL as I did to confirm this.

Because digipeating can not be used this year VHF/UHF packet has effectively been killed.

Technically it only says no repeaters. Anybody else have an opinion? A digipeater is technically quite different from a normal repeater....

Actually it does forbid digipeaters. There are the Feild day rules and
then the ARRL General Contest rules. There is a hyperlink at the top
of the page you might of missed to the general rules.The general rules
forbid Digipeaters.

My gripe is that packet has always been a show peice. Why bother this
year.

not sure about the league ,but I think packet is on the way out
due to several causes. the internet is one, but the cost of a moutain
top digipeater is as high as a voice machine ,and the control group
does not have the huge user base to help.

I don't understand how anyone can say that packet is effectively
dead for the contest. That's why we have rules. If we all
follow the same rules, then we all have the same chance.

If you stop and think about it for a minute, you will realize that
using repeaters of any kind is CHEATING. That's kinda like taking
a friend along to a boxing match to help you.

In response to Jacks note:

First I do not want to start a flame war. It is after all the ARRLs contest and they can state the rules as the see fit.

I started this thread so the change in the rules would not catch packet radio operators by surprise.

As there is no standard calling frequency for packet radio, contacts this year will be a real hit or miss thing.

Field day has always been an emergency prepardness exercise. Part of field day is teaching radio operators how to plug into networks like NTS. Being able to plug into a packet network in times of emergency has been in the past of great benifit.

Last year people were plugging into hard wired internet gateway stations and HF BBS stations. People were racking up 400 to 1000 contacts. That probally the reason digipeating was killed for this year.

It made the 20 to 30 contacts I usually make look puny, it was enough to qualify for the bonus however, and that made it worthwhile. After I got the field day message relaying it was done on packet.

Personally, I full well intend to get on the Packet cluster prior to field day, and post a message to the BBS side of the cluster.

I will give my clubs packet frequency, (145.11 Mhz), Field day location and invite them to connect to me then come to the pot luck dinner. Who knows we might get an operator or two out of it.

I think what probably got the rules changed was the fact that a ton
of people were using the TALK function on the DX cluster system
to make contacts, and a lot of the cluster operators got upset
because the users were yelling......

Hi. I have Kenwood TM-241A 2m Transceiver for sale. I'm the original owner.
It is in absolutely perfect condition....been used for indoor packet
operation only. Includes....radio, microphone, manual, schematic, mounting
bracket (for mobile operation), original box, etc. Asking $165.
I'll pay shipping and insurance (to continental US). If interested, please
email to the address listed below, and we'll swap particulars.

Thanks very much,

Ken, N1NEG

> If not the suggestion of the ps2 mouse sounds like a real winner.

On our computer there were bad problems using COM3 because it has
to use its default IRQ4 which is also used by the mouse on COM1. The
motherboard startup CMOS insisted on having the onboard serial ports
be COM1 and COM2 if present. You had to disable COM2 in CMOS if W95
was later to be able to use it for a modem. There is no PS2 plug for
a bus mouse.

The easy dodge was to use W95 Device Manager to remove COM3, and then
Add_New_Hardware to create a COM4 without conflicts. Then finally, to
add in the modem on COM4. Don't allow W95 option to autodetect the hardware.
This also presumes you get to set the link on the modem card telling it
it is a COM4 gadget. HamComm gets to use COM2, and you don't need to
fool about with the default h31.cfg file.

To get the machine to assign a new non-default interrupt to COM3, such as
IRQ5 suggested in my modem manual is a techie trick beyond my ken. I settled
for dumping COM3.

Hope this helps

I presume you mean the 802.11 - its a good idea and some people are working
on it at the University of Oslo, Norway. You can run any protocol over
802.11 but AX.25 is a data link protocol, so is 802.11 so you use one or
the other.....
...you could use IP and TCP over it however.......

> Also:

The problem with using ethernet on radio circuits is that the way ethernet
detects contention (two stations TXing at the same time) will not work on
radio systems, only on closed wire circuits.

You're probably right. I believe Hamcomm uses some timing loops that will become unstable in a Windows 95 DOS window. If you're already in Windows, select Run, Shut Down, and Restart the Computer in MS-DOS mode. Then run Hamcom and redo the calibration process.

Don't worry about it - the software is probably not checking to see
what the level of input signal is and is continuing to take samples
for the analog to digital conversion even when there's nothing there -
so it gets a bogus signal and occasionally sees a bogus rtty character
or two. Other than being a bit obnoxious, it's not a big deal.

You should probably make sure you wire up the transmit and receive
cables using the audio isolation transformers as described in the BTL
help.

The ARRL says Field Day is not a contest. It is an emergency preparedness exercise. (Ha, ha) As such, it shouldn't fall under the general contest rules. And it does seem strange that the American *Radio Relay* League would outlaw *radio relay* as a method of operation. But of course Field Day *is* a contest, and like any contest, ideas of cooperation and networking are alien to those running the *competition*.

So, what would be the official ruling since Field Day is a Emergency Preparedness Exercise and not a true contest (though we snicker and say yeah right), can we do it anyway? I'd hate for my station to get disqualified (and its not just me that will be in the contest at the station site) and carry the rest of the club's points with it. I think I would be mysteriously electrocuted...

Source record: 23626

My pick is that WIN95 is at the root of the problem. Start the PC in DOS mode (press F8 when the PC beeps during boot-up and then select item 6). Then run Hamcomm. You may have to recalibrate the timing.

Win95 isolates the real world serial ports from applications via several layers of code, and there can be serious timing issues when code needs very accurate timing - which it often does in Ham applications. The solution is to write proper WIN95 software with DLLs to handle the timing, or simply avoid Win95.

Operating is a DOS box usually won't help (although it works with Win 3.1). Stick to good old DOS.

73,

Fred

Timewave are offering a $200 trade-in for a DSP-232 against the new DSP-
2232zx premeried at Dayton, which is $599 new. They are no longer
supporting the DSP-232, which effectively sent AEA into bankruptcy
according to e-mail I have had from Timewave.

The official ruling is that you can't use repeaters or digipeaters.
It doesn't have to make sense, the ARRL runs it as a contest
despite blather to the contrary about emergency preparedness.

2769. Alternative for PC-PAKRATT?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-20 00:00:00 UTC
From: Egon Z&#65533;rrer <egon.zuerrer@swissonline.ch>
Message-ID: <358BC4AC.C137CA1E@swissonline.ch>
Source record: 23548

I use digital modes by means of AEAï¿½s DSP-1232 and PC-PAKRATT software
(DOS-or
WINDOWS-Version), which often makes me angry due to the impossibility to
copy the
callsign of the QSO-partner from the screen into the macros, as is
possible, for instance, with Masterterm of SCS.
Is there any other software available (freeware/shareware/commercial)
that would solve this
problem? Since PC-PAKRATT is designed for all AEAï¿½s data controller
(including PK-232MBX), it seems that, for instance, software for the
latter would be all right as well.
Any info would be very much appreciated. Many thanks in advance and best

Egon,

Try XPWIN, that will run happily with most of the Timewave TNCs. I don't
have the URL but you should be able to locate it on the Web. It is
shareware and so you will have to pay the fee if you use it more than
100 times! It also includes rig control and logging facilities.

Most of these are point-to-point and highly directive beams. There is only the
two
so no collisions (it is also full-duplex). They use Spread Spectrum on two
bands.
(3 and 5 GHZ).

Point to point (2 users per channel) is OK using ethernet (802.3) onto a
radio carrier, but it can't be used for multiple user access.

IEEE 802.11 is a wireless multiple access LAN technology that uses Spread
Spectrum in the 2.4GHz band.

have a look at http://www.semi.harris.com for info on chipsets etc.

I won't comment on your obsolete computer...

What you want to do, is to take the audio cable and twist on and
solder another pair of wires. Then run this new cable to a DTMF
decoder circuit. There are 100's of these designs in the Library
Electronics section.

If you had a modern computer (post 1990), you could use a sound
card to do the DTMF.

After decoding the DTMF, you can basically control the world.

I know Quebec is going backwards in time, much like Iran, but
at least Iran doesn't have any VIC-20's or C-64's...

You can try KaWin _before_ you buy. It's not a test drive version, it's the fully functional program, but the run time is very limited once you begin to transmit. Try it, you'll like it. Download it from the web site below.

Hello Ham Folk

Many thanks for the replies. I tried the "cure" at Bill's (G4ZKJ) QTH
last night, and you were right. Running DOS programs under W95 gives very
serious timing problems with realtime programs.

Restarting in MSDOS mode, running HamComm, doing a timing recalibrate on
a stable SITOR station seemed to make a *big* difference. We can now receive
and transmit AMTOR.

For some reason not yet diagnosed, RTTY and CW does put the rig into Tx
mode, and the characters in the buffer act as if they are being sent,
but no rig output happens. We investigate further (ie. RTFM!).

Bob Lewis <aa4pb@erols.com> wrote:
> I believe Hamcomm uses some timing loops that will become unstable in a
> Windows 95 DOS window.

Yes - and even if you select "full screen" mode too!

> Fred wrote:
> > Win95 isolates the real world serial ports from applications via several
> > layers of code, and there can be serious timing issues when code needs
> > very accurate timing - which it often does in Ham applications.
> > The solution is to write proper WIN95 software with DLLs to handle
> > the timing ....

Hmm.. so every time the guys who think up Windows feel like a change,
it turns all our software into trash until we buy some more resources?

> > or simply avoid Win95.

Not so easy. Even restarting in MSDOS mode (DOS7) does not free you
entirely from W95 interrupts. W95 needs to be aware of any new files
appearing or edits happening, so it does not have to do a disc scan
at startup.

W95 found and "modified" my private separate copy of DOS6.22 which I
launch from a floppy bootup. It replaced all commands that had anything
to do with file handling (XCOPY, COPY, etc.) with batch files pointing
to its own versions, and it trashed completely some others (DELTREE, etc).
If you got your PC with the OEM version of W95 installed you may even
find your hard disc has been formatted to a nonstandard Microsoft norm.
(I used FDISK from a floppy boot first!)

> > Stick to good old DOS.

Hardly possible. I don't know if I have the smarts to properly get
to grips with DLLs.

I have now been looking on the web for SOUNDCARD based ham programs.

see --> http:/www.muenster.de/~welp/sb.htm

for Oliver Welp's Amateur Radio Soundblaster Software Collection.

Ta much to Bob and Fred for a good tip

Anyone using the Alinco DR-150T for packet?

It sports a packet port, however I am not certain that the packet port is useful for both 1200 and 9600. I ask this because the Alinco DR-605T also sports a packet port but the review in Dec 1996 QST notes that it is useful only for 9600. For 1200 you are told to input into the microphone jack. Is this the same for the DR-150T????

Reply to group please - my address is twisted.

The "packet port" on newer radios is usually wired direct to the
discriminator and that other thing (varicator[?]) so that your 9600 modem
can do Direct FM. 1200 is AFSK which is wired to the speaker-mic port.

He didn't run down Amateur Radio, he merely stated the obvious fact
that Field Day is run as a contest, and has little or nothing to do
with its alleged purpose of practicing and demonstrating readiness to
handle emergency communications.

If I recall correctly, he managed to do it without calling anybody a
stupid jerk, too.

Hello,
I have the following items for sale! All are in excellent condition and all still have receipts and boxes.

1) KPC-3 Plus. Asking $100.
2) Alinco Data Radio. Operates on 2 meters, no mic. This was used for Packet radio. Never in car. Model DR:1200T. $300.
3)Sportster external 33.6 modem. Upgradable to X2. $140

Any questions on any of the above, please drop me a note. I tried to make this ad very short.

Thanks,
Art

I can attest to that. The HamComm interface, is *very* good. The comparator produces a black on white (or white on black - you choose) when the Rx sig crosses zero. The full intensity-modulated display is yet another dimension into this mode.

Even if the majority of the transitions are noise, the non-random nature of the *wanted* speckles and the pattern-recognition abilities of the brain make the text just obvious.

400Hz seems generous. I saw a Hellschreiber conducted about 100Hz from the carrier right in the middle of another station's sideband. There was no QRM. They were not even aware we were there. QRP seemed more than enough. QSO was 14.065 from UK South coast to DL.

To get on Hellschreiber, you only need the LA0BX software and a HamComm-type interface. Hellschreiber is covert almost by nature, and extremely effective, but it can get badly messed if you try it short-range on 80m where the other station gets the signal direct, then again straight off the ionosphere. Choose a band where where you use one wave or the other - not both.

About the EVM Kit.
This is a Motorola evaluation kit for the DSP56002, and the kit has the part number DSP56002EVM. It is a 1/2 Eurocard (160 x 100) card containing a 24-bit DSP chip with dual port fast SRAM, a CS4215 full stereo CODEC, and a 68HC705 microcontroller.
Also comes with cross-assembler, debug software & user interface, Demo files, Manuals, A CD of Technical Documentation, another CD of DSP development software. etc. I have no idea (yet) how much of the CD's are "demo" stuff.

A UK supplier is:-
Future Electronics Ltd.
Future House.
Poyle Road.
Colnbrook. Berkshire.
SL3 0AA
Tel. 01753 763000

Other country suppliers can probably be unearthed when I finish checking out the CD that came with the kit.

It cost 103ukp + 17.5%VAT

Now - to turn the kit into a rig signal processing devil, you *do not* need to get deeply into DSP assembler language programming! Step 1 is to fit a 28-pin x 0.6" DIL socket for a 32K x 8 EPROM memory, which is used as a bootstrap loader. It can be the Amtel AT29C256PC or similar Flash EEPROM, or just a generic u/v eraseable 27256. You need to fit a 9-pin "D" socket for the RS232 serial port, (not to confused with what Motorola call a OnCe port.

There are full audio input and output sockets fitted. You need 7.5-9.0volts at 650mA worst case (thirsty!), which needs a regulator if you want to pinch power from the rig's 12V line. Mount all in appropriate little DSP case with rubber feet.

You put the loader software into the EPROM. The rest of the smarts are sent into the SRAM in a second or two when you start using it by running a DOS program.
From that point on, you can use the Hellschreiber software with the DSP.

I have not yet aquired the software, but I *think* the URL was given elsewhere in this thread.

No, he merely took a cheap shot at something he doesn't happen to
like about ham radio - contests. He called us all stupid jerks, you
just don't know how to read between the lines yet.

Field day is probably the best opportunity any ham has to get out
of the basement and learn a few things. It has everything to do
with its alleged purpose.

Anyone who can operate a radio during a contest should
have no problem passing emergency traffic, should the need arise.
Anyone who has been at field day can probably get a dipole up in
a tree and start a generator, should they wind up on the business
end of an emergency.

Unfortunatly, Gary will be home calling CQ on Gtor instead of
going out to play with the other kids......

Commodore's VIC20 and 64 computers are very well suited for use in remote control applications. I recommend that you try and pick up a used 64 at a garage sale or Hamfest, since the VIC20's limited memory can get in the way of writing complete programs. The limited amount of text that the VIC's screen can display can be very frustrating and hard to format in a pleasing manner.

You can interface a DTMF decoder chip (such as the 8870 or 202) to the computers "control port" (game paddle connector) on the side of the unit - near the power switch. The port supplies 5 volts on one of the pins, so you can power your interface that way. Connect the DTMF chip's DV (Digit Valid) pin to the "fire" button pin on the port. Connect the chip's D0 through D8 pins to the port's "paddle" pins. Connect the chip to the port through a 74LS05 inverter. This will pull the control port's paddle and fire pins to ground whenever the chip's data pins are active. By using BASIC's PEEK command, you can read the memory address of the control port. You will be able to read the state of the decoder's output this way. Write your program to only decode the data lines when the DV line is active (the "fire" button is pressed).

Another problem with using a VIC20 instead of the 64 is that the VIC
didn't use a single memory address for all of the port's pins. This means
that you have to write a much more complex program to read the port and
make use of the data. With the 64, you can do it in a single line:

```
10 P2=56320:IF NOT PEEK (P2) AND 16 THEN PRINT NOT PEEK (P2) AND 15
20 GOTO10
```

You can verify this by plugging a game paddle into the 64's port CP2. Move
the paddle around, and whenever you hit the "fire" button, the equivalent
DTMF value will be printed on the screen.

For an output, you will be able to use the computer's USER port (rear left
of the computer, as viewed from the front). The edge connector used for
this port has 5/16 inch pin spacing. Set the USER port's pins for all
outputs, by POKEing the Data Direction Register with the appropriate value.
Now all you have to do is write a program that POKEs the USER port's address
whenever a selected DTMF tone, or string of tones, is received. If the input
command matches one in your program, then you can have it set any one of your
8 USER port lines to HI or LO. I suggest you use LO=ON (active=ground) for
the connected equipment, and buffer the USER port with TTL chips or
transistors.

In order to attempt a project of this magnitude, you will require
documentation. I suggest you access Project 64 at the following URL:
http://ourworld.compuserve.com/homepages/pcgeek/proj64.htm
go into the Miscellaneous section and download:
C64 Programmer's Reference Guide [c64prg10.zip] and
Mapping the Commodore 64 [mapc6410.zip]

In 1994 I constructed a simplex autopatch for the 64. It has CW-ID,
autodial, variable-rate VOX sampling, time-out and safety timers and tones,
activity logging and all of the features of the commercial models. It is
written entirely in BASIC, and has never crashed in its daily use except
due of power failure. I keep intending to write it up as an article, but
so far intentions are as far as I've gone. That ALL the notes, documents
and diagrams I made for it were thrown out by a family member on a cleaning
binge is a good part of the reason. The computer ports I have described
in this post are electronically and physically the same in both the VIC20
and 64 computers, as far as the interfacing equipment is concerned.
Therefore, any interfaces you construct will operate on either computer,
provided the appropriate programming changes are made.

I have cross-posted my reply to:
news:comp.sys.cbm
I suggest you follow the newsgroup regularly. If you hit any programming
bugs, they will be the people to ask about it.

When using the C64, there are some schematics at
http://www.tu-chemnitz.de/%7efachat/8bit/c64/csa/index.html

It explains a bus interface for the C64, to expand it with
other I/O chips. If you only use the userport, it's much simpler,
but I don't have schematics for that. I only know that lines
A-M are connected to an 8-bit port and 2 handshake lines.

On http://www.funet.fi/pub/cbm/schematics/computers/index.html
you can see schematics of the Commodore computers.

I sent email to contests@arrl.org asking for clarification on this topic, specifically
for APRS use during FD. Received the following:

Packet can not use digipeaters, nodes, BBS, etc. Packet contacts are logged
under the new digital mode and can be used on all bands.

73, Contest Branch

The fact that the Contest Branch was what I emailed to and got a response regarding Field Day speaks volumes as to what the ARRL considers FD to be.

to me it is a contest to promote disaster preparedness.
it has points and scoring, so it is a contest.

I use a DR-150T for my APRS digi and according to my manual (and the way
I have the radio/TNC set up), for 1.2kb packet, you feed TXD from the
TNC to the mic pin 1, PTT output goes on mic pin 2, mic pin 7 is GND for
TXD, mic pin 8 is GND for PTT and pull RXD from the external speaker
jack.
For RXD from speaker jack connect RXD to TIP of 3.5mm audio MONO plug
and GND to ring of the same plug.
CAUTION: NO (I repeat NO) connection to mic pins 3,4,5, and 6.

I use a MFJ-1272BYV MIC/TNC switch to retain the voice function if
needed.

Dear Friends,

I will go Friedrichshafen HAMRADIO, HAMTRONIC fair, I'm looking for a friend who is experienced with national monitoring systems. I want to talk with him/her for every aspects of their systems. I will not take so much time.

You can put a message at the TRAC (Turkish Radio Amateur Club) stand. I have some amateur friends at this stage, we can meet at night time and discuss some monitoring issues, If you have time of course.

Thank you for your cooperation.

P.S If you forward this message to your friends (interested in monitoring systems), I will be happy. We can also discuss monitoring systems issues via email.

Last I knew, packet, digipeating, and switching services were all ways of passing a message just as well as voice. And it can be run from a mere deep cycle boat battery for an entire field day (more like a week with a older 8bit machine. I am working on a TCPIP/BBS implementation for my CoCo 2/3 now for low power station useage) unlike the big 1KW voice stations because it takes advantage of a redundant message passing structure. This isn't an insult to amateur radio, but a direct accusation by me towards the ARRL for their treatment of packet during a so called "emergency preparedness" contest. My position is that there isn't anything about emergency preparedness in such a contest if it ignores one of the best ways to transfer a message. Maybe the focus of the ARRL has been shifted away from true service, and a medium to preserve bandwidth for its own selfish contests? It sure seems that way to me.... Now I'm sure someone who loves to insult any one who opposes him in this group will attempt to use manipulative devices to turn my words around, but so be it. The fact remains that:

The ARRL has reduced Field Day to a mere contest. Its no longer a question of emergency preparedness.

I'm a paraglider pilot in Seattle. Our club uses the 151 MHz band for comms. I just discovered that my newly-acquired TH-22AT does not transmit above 148 MHz.

I thought I was hosed.

But then a little bird told me there is a quasi-legal fix; a way to program the thing to transmit above 148 MHz. Does anybody know how I can do this?

Source record: 23492

For those of you who would like to investigate Amateur Packet Radio without having to invest in a lot of equipment...

You can use a 16-bit soundcard as a TNC with PC/FlexNet software, it's SBLAST driver, and a PTT interface which works from either a Com port, Parallel port, a Joystick port, or even from a VOX circuit which works from the Mic audio.

I built the Com port interface (One transistor, one resistor, one diode) for just over three dollars and the "soundcard TNC" performed very well.

The SBLAST driver uses a lot of the computer's resources. If you have a really fast computer with lots of RAM, you may be able to run two of them at once.
On the other hand, used 386 PC's are getting to be cheaper than regular TNC's, and the PC's software can be easily upgraded or changed at will.

See the FlexNet articles and info at my web site for more info... Just push the FLEXNET button, and go from there.

1998 ARRL and TAPR Digital Communications Conference
September 25-27, 1998
Chicago, Illinois (minutes from O'Hare Airport)

Web: http://www.tapr.org/dcc

It's that time again! Mark your calendar and think about what to publish for the upcoming 17th Annual ARRL and TAPR Digital Communications Conference. This is the third year in which the ARRL Digital Communications Conference and TAPR Annual General Meeting are joined into one conference!

The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies, who meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital expert, but for digitally-oriented amateurs at all levels of expertise.

The 1998 ARRL and TAPR Digital Communications Conference will be held September 25-27, 1998, in Chicago, Illinois. This year's conference location is the Holiday Inn Rolling Meadows, just minutes from O'Hare Airport.

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes APRS operators, digital networks, software writers, modem designers, and digital satellite enthusiasts. The ARRL and TAPR Digital Communications Conference is for all levels of digital operators -- a must conference to attend to become active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds because it is important that we demonstrate a continued need for the frequency allocations we have by pushing forward and documenting our achievements. The ARRL and TAPR Digital Communications Conference is one of the few ways to record our accomplishments and challenge each other to do more.

A Conference for the Beginner, Too

The conference is not just for the digital expert. This year's conference again provides multiple session tracks for beginning, intermediate, and

advanced presentations on selected topics in digital communications. Topics will include APRS, satellite communications, TCP/IP, digital radio, Spread Spectrum, and many others. Come to the conference and hear these topics presented by the experts! Don't miss this opportunity to listen and talk to others in these areas.

Symposia and Seminars

In addition to the presentation of papers on Saturday, three symposia/seminars will be held. These sessions are provided to allow those with additional time and interest to make the most of the Digital Communications Conference. For those who may have interest in just one symposium or seminar, registration for the conference is not required to attend these activities. This allows maximum flexibility for those who may want to participate during the Digital Communications Conference, but do not have an entire weekend to devote to the event.

The Second APRS National Symposium will be held on Friday and will be moderated by Steve Dimse, K4HG (the developer of javAPRS). It will likely include many APRS software authors, such as Bob Bruninga, WB4APR (the father of APRS), Keith Sproul, WU2Z, Mark Sproul, KB2ICI (the developers of MacAPRS and WinAPRS), Brent Hildebrand, KH2Z (the developer of APRSPLUS), and other nationally-known APRS leaders. Join this group for the afternoon and evening for in-depth discussions and presentations on the current and future status of APRS. This is a unique opportunity to gain insight into this fast-growing digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning System).

Starting late Friday afternoon, a half-day seminar titled "Infrastructureless Technologies in Amateur Radio," presented by Don Lemke, WB9MJN, will cover the pros and cons of DDMA (directivity division multiple access, a proposed infrastructureless technigue) versus hubbed (cellular style) and other infrastructure dependant techniques, the basic problem of megabaud rate communications into the ham QTH, and some techniques for channel-area acquisition including full duplex/asynchronous versus simplex/synchronous radio/acquisition concepts. This seminar will start late enough on Friday afternoon to allow those flying that day to attend the seminar.

The Sunday morning seminar will be a combination of two different talks that will make one excellent seminar. The first presentation, by Lyle Johnson, WA7GXD, will focus on the upcoming RUDAK digital communications system scheduled to fly on the AMSAT Phase 3D satellite in the near future. Lyle will discuss features, systems design, integration, and experiments. The goal of the presentation is to zero in on the communications capabilities of RUDAK, the performance to be expected from the 153k6 PSK system, the limitations and capacities of the DSP modems, user requirements for receiving RUDAK, requirements for transmitting to RUDAK, and how amateurs can work to make ground operations a reality once the satellite is in operation. Information on how to submit a proposal for experimental

time on RUDAK will be presented. The second presentation will be by Tim Shepard, KD1KY, regarding "Packet Radio Networks with Millions or Billions of Stations." This talk will present concepts and materials that make you think about different possibilities of networking in the future. Both Lyle's and Tim's presentations focus on different aspects of future digital communications possibilities.

Third Annual ARRL and TAPR DCC Student Papers Award

ARRL and TAPR especially welcome papers from full-time students to compete for the third annual student papers award. Two $500 travel awards may be given, one in each of the following categories: a) best technical/theory-oriented paper by a student, and b) best educational or community-oriented application paper by a student. The paper should relate directly to a wireless digital communication topic (see the guidelines for more information). Papers co-authored by educators or telecommunications professionals are also eligible for this award as long as a student is the first author. The deadline for receipt of finished student paper manuscript is June 20, 1998. Please note that this deadline is different from the general conference paper submission date. For full details and paper guidelines contact TAPR or browse to http://www.tapr.org/dcc.

Call for Conference Proceeding Papers

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the conference is not required for publication. The primary purpose of the conference is to communicate ideas and techniques regarding digital communications. Papers written in an informal style are welcome, as well as those written to academic standards. If you know of someone who is doing great things with digital communications, be sure to tell them about this! Papers are due by August 15, 1998, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111, or via e-mail to lweinberg@arrl.org. The paper submission guidelines are available on-line (http://www.tapr.org/dcc).

Local/International Co-Host

The 1998 ARRL and TAPR Digital Communications Conference will be co-hosted by Chicago Amateur Packet Radio Association (CAPRA). CAPRA is one of the oldest packet radio groups in the US. It focuses on education about amateur packet radio, coordination of joint efforts of hams interested in packet radio, and technical and equipment support for a sound packet network in the Chicago area. They have had high-speed packet networks operational since the mid-1980s. Visit the CAPRA Web site at http://www.imaxx.net/capra for more information.

PRUG (Packet Radio User Group of Japan) will be the first International co-host of the ARRL and TAPR Digital Communications Conference. The conference is proud to welcome PRUG as part of the conference. PRUG will be hosting an informal social Friday evening after the seminar and symposium are completed. Visit http://www.prug.or.jp for more information about the organization.

What can you expect during the 1998 ARRL and TAPR Digital Communications Conference?

* A full day of papers, breakout sessions, and selected topics on Saturday for the beginner to advanced amateur digital enthusiast.

* Three seminars/symposia
Friday (1 PM)
- Second Annual APRS National Symposium,
moderated by Steve Dimse, K4HG

Friday (3 PM)
- Infrastructure Technologies in Amateur Radio
conducted by Don Lemke, WB9MJN

Sunday (8:30 AM)
- RUDAK Future Operations and Experimentations
by Lyle Johnson, WA7GXD
- Packet Radio Networks with Millions or Billions of Stations
by Tim Shepard, KD1KY

* Third Annual Student Paper Awards.

* TAPR Membership Meeting

* A banquet with special guest speaker Steve Roberts, N4RVE, of Nomadic Research Labs. Creator of the Winnebiko and Behemoth high-tech recumbent bicycles. His current project is focused on Microship technology (http://www.microship.com/).

* SIGs (Special Interest Groups) get-togethers on Saturday, following the banquet

* Informal get-togethers throughout the weekend

* A facility that is perfect for this type of conference

* Informal engineering discussions/demonstration areas

* Motorola Museum located in the area.

* An event at which the most important new developments in amateur digital communications are announced

* Digital 'movers and shakers' from all over the world in attendance

---

Conclusion

If you have attended a Digital Communications Conference in the past, remember how much fun it was discussing the latest developments into the wee hours! If you have never been to a Digital Communications Conference, then make your plans now to attend and find out how much fun they can be.

There are few activities where your participation can be so much fun and so important! You will be able to get together with colleagues from all over the world and bring each other up to date on your latest work. Experience all this and more for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to see you at the ARRL and TAPR Digital Communications Conference, September 25-27!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337, Tucson, AZ 85749-9399, phone 940-383-0000, fax 940-566-2544, e-mail tapr@tapr.org, browse www.tapr.org/dcc.

Sincerely,

Steve Ford, WB8IMY, ARRL Conference Co-Chair
Greg Jones, WD5IVD, TAPR Conference Co-Chair
Steve Stroh, N8GNJ, Conference Manager
Mark J. Thompson, WB9QZB, Local Host Liaison
Carl Bergstedt, K9VXW, Local Host Liaison

Note: If you need conference handouts or flyers for ham club meetings, contact TAPR to get what you need!

Hotel Information

Conference presentations, meetings, and seminars will be held at the Holiday Inn Rolling Meadows. Special DCC rooms rates are $85 per night. When making reservations with the hotel, be sure to indicate you are attending the ARRL and TAPR DCC in order to get the discount. It is highly recommended that you book your room prior to arriving. A block of 75 rooms is reserved until August 31, 1998. After the 75 rooms are booked, rooms will only be available in nearby hotels, so be sure to book your rooms early! The hotel provides transportation to and from O'Hare Airport. Please contact the hotel to arrange specific transportation needs.

Holiday Inn Rolling Meadows (conference hotel)
3405 Algonquin Rd
Rolling Meadows, IL 60008
Phone 847-259-5000, fax 847-259-0597

Registration

Contact the TAPR office by phone, fax, or e-mail (numbers and addresses are above) to register or for additional meeting information. MasterCard and VISA are accepted.

- Preregistration (before Sept 1): $42.00 *

- Late registration or at door: $47.00 *

* - Conference registration includes Conference Proceedings, Saturday sessions/meetings, and lunch.

- Saturday Evening Dinner (limited space): $20.00 **

** - Includes dinner, speaker, prize drawing

Seminar/symposia

Note: You do not have to be registered for the conference to attend one or more of the seminars/symposia.

- Friday, 1-8 PM, Second Annual APRS National Symposium (full day)

Registration: $25***

- Friday 3-7 PM, Infrastructure Technologies in Amateur Radio, conducted by Don Lemke, WB9MJN

Registration: $15***

Sunday 8:30-11 AM and 11:30 AM-2 PM, RUDAK Future Operations and Experimentations by Lyle Johnson, WA7GXD, and Packet Radio Networks with Millions or Billions of Stations by Tim Shepard, KD1KY

Registration $20***

*** Cost of seminar or symposium includes the cost of handout materials.

Contact TAPR to register for the DCC:

Tucson Amateur Packet Radio
8987-309 E. Tanque Verde Road #337
Tucson, AZ 85749-9399.

It wasn't a cheap shot, it was a fairly accurate assessment of the
situation.

>like about ham radio - contests. He called us all stupid jerks, you
>just don't know how to read between the lines yet.

Nonsense.

>Field day is probably the best opportunity any ham has to get out
>of the basement and learn a few things. It has everything to do
>with its alleged purpose.

I disagree strongly.

>Anyone who can operate a radio during a contest should
>have no problem passing emergency traffic, should the need arise.
>Anyone who has been at field day can probably get a dipole up in
>a tree and start a generator, should they wind up on the business
>end of an emergency.

There's a hell of a lot more involved in emergency comms than just
setting up a jury-rigged HF station.

>Unfortunatly, Gary will be home calling CQ on Gtor instead of
>going out to play with the other kids......

For the ARRL to virtually eliminate the digital modes from FD is right
in character for them. The ARRL has done little or nothing to promote
packet and related modes since they helped set up the ax.25 protocols.
It's self-serving and shortsighted of them, as is a lot of what they
do.

So should you. Nothing that's run as a contest, and scheduled months
or even years in advance is going to do much to prepare the average
ham for real emergency comms.

Source record: 23502
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

Hi all,

has anyone come across this problem with a PacComm Tiny-2 TNC?
It is DEAF! I need to set the volume control to full to get it to
register data, and even then faint (i.e. low deviation) signals are
missed. This sensitivity seems far removed from the manual's
recommendation of "...10-700mV".

I think I saw a modification once to cure this, but on looking at the
instructions it seemed completely un-related to the receive audio path.
I've looked on the 'net, but can't find it again..

Thanks,

Source record: 23503

Hi,

After the loss of AEA we have another let down with Timewave going
into chapter 11 bankruptcy.
(protection from creditors while restructuring.. I believe)
(Must be like receivership in NZ).

Anyone have the list of the DSP-232 known problems and work arounds
that has been mentioned by the Timewave service manager?

Which are the best ROMs? I have heard there are 3 versions.
My DSP-232 was shipped with V 1.0 lot 03, 05.mar.96 and I have
upgraded and I am currently using V 1.0b Lot 30, 06.Nov.96.

Timewave has mentioned a trade-in option of US$200 on a new
DSP-2232zx. Responses from AES and HRO in the USA indicate no
knowledge of this offer or stock of the DSP-2232zx.

Anyone have any code patches or other fixes for the apparent serial
port hand-shaking problem?

This is quite a common fault on TNC2's

Its got something to do with the TCM3105. There is a mod with a transistor
you can do to increase the audio volts but have you tried turning the audio
pot in the TNC?

RTFM if you haven't.

The following comes from N2EZG:

Msg# TSP Size Read To @ BBS From Date/Time
25853 BN 1240 0 ALL N2EZG 8903/1617
Subject: Paccomm Tiny-2 Factory Mod

Here is the "Factory" fix for Pac-Comm Tiny-2's & Micro-Power 2's
that have become hard of hearing. It seems that Pac-Comm has some
boards out that work fine when new, but with age the tnc requires
a huge amount of Audio input from the speaker jack or it won't
decode properly. They are lost as to what is deterioating in the
boards but offer this fix to its customers.
It is quite simple and very neat, all parts are mounted on the
under-
side of a 16 pin IC socket, the Modem chip TCM3105 (U16) is
removed,
the modified socket is inserted into existing socket on TNC's
board,
and the modem chip is re-installed.

Parts Needed:
1 - 16 pin IC socket
1 - 2222 Transistor NPN (EGC 123AP)
2 - 10000 ohm 5% resistors (brown-black-orange-gold)

Instructions:
Solder 1 resistor to Emitter, other end of resistor to pin 12
Solder 1 resistor to Base, other end to pin 2
Solder collector to pin 5
>EndFile<

By "register data", do you mean that the DCD LED doesn't come on until you apply a high level of audio? If you do, then:-

There's an internal jumper JPRA (at least in the Tiny-2 Mk2) which affects the input impedance of the TNC. If you're driving the TNC from an external speaker socket, which you presumably are, then the jumper should be on. If you're driving it from an output that precedes the audio output stage in the radio, then try removing it.

There are two presets associated with the TCM3105. One of them, if badly adjusted, can give the impression that the TNC is "deaf". On the Mk2 it is R26 (the wiper goes to pin 10 of the TCM3105). It should be set so that the DCD LED is off when there is no noise input to the TNC, but comes on as soon as there is a low level of noise input. (This assumes that the TNC doesn't have any sort of digital DCD board fitted.)

Blah blah blah, ect... Talk is REALLY cheap, especially when it comes from LandLine Lids.

The ARRL is interested in emergency communications using RADIO.. That leaves amateur TCPIP out of the picture, OM. It's not a "digital communications hobbyist" event... It's for Ham Radio Operators. - Using Radios.

Amateur Packet RADIO has been used at most field day sites I've seen in the last ten years, but amateur TCPIP enthusiasts like yourself have been very conspicuous by their abscense.

In fact, I have heard a lot of TCPIP geekoids complain about how the real Hams handle emergency traffic, but I have yet to see a TCPIP geek get off his ass and actually do anything useful himself... It's so much easier for them to piss all over the work of others than it is to actually do something themselves.

Stupid Jerks. None of them deserve better than the back of any real Ham's hand.

>***The ARRL has reduced Field Day to a mere contest. Its no longer a
>question of emergency preparedness.***

You wouldn't know "emergency preparedness" if it slapped you in the face, David. You're a moron who can't even understand why Hams use Radios.
When the emergency comes up, you'll be getting a "busy signal" while the real hams will be ON THE AIR. - They'll do so much more quickly and efficiently because of their work at field day, whether you have enough intelligence and respect for the work of your fellow hams to recognize that fact or not.

Stupid Jerk.

Emergency preparedness is the ability to respond to an emergency with
water, food, and any other necessities to continue life in the face of
disaster. Communications with the outside world is only one road to
achieving that goal.

As to my respect... I participate in field day. I'll be right there when
the generator cranks and the antenna's go up, with my own equipment.
Though this year, I will be less effective because of the ARRL ruling
class's less than intelligent view of digital *radio* communications,
because digital communications is my end of the stick in our club, and
with this years ruling, I will not be able to use redundant digital
radio links to make contacts. Not to mention, it will be a pretty boring
station, and most visitors that aren't already HAMS are more interested
in digital than HF anyway (unless you consistently talk to Australia).

>
> Stupid Jerk.

Charles, your character must really suck for you to attack me this way. I advocated the use of redundant digital *radio* links. I think anyone else here could be the judge of that. There is no need for me to hurl back an insult, your character has taken care of that for me, through its manifestation in your attitude toward others.

David - KF4MOK

PS: I was expecting a maliciously manipultive attack, but it looks like I only received a random rant about land line lids. Imagine that from Charles....

Maybe you could convince the ARRL to allow these service in the Field Day.
I would think that all paths would have to be setup Friday and Saturday.
Nothing could be in place before the contest started. If you present this
to the ARRL showing that you can establish a usable network in the field
quickly, maybe they would/should setup another class for pass through
traffic.

I don't know about networking. Could you establish a network on the fly
without using any established infrastructure?

I think that Field Day IS a contest that is ABOUT emergency preparedness.

TCPIP runs over AX25 just like traditional packet. Saying that it's
not RADIO is just like saying a ham from another country is not a ham
just because he or she speaks a different language. Maybe you should
know what you're talking about before you start whining.

For voice, yes. But for packet modes, they (ARRL) are not encouraging anything. And it happens to be the most efficient of any of the modes. That means that the only separation of the Field Day contest and any other contest, is that its called Field Day and you run your station from the deep cycles you have stored away and charging in the corner, or your generator. Alot of people do this in lightning storms to talk on two meter repeaters. So why cut out packet? There is not an emergency calling frequency that I am aware of for packet. On the contrary, it has always relied upon the switches, bbs's and digipeaters that makes up the system.

However, I see your point and like your idea about an instant up network. Perhaps the ARRL could be petitioned to allow such an adventure to occur next year. Perhaps not a complete new network, but all switches (that can be used for contacts) would have to be temporarily brought up and run for 24 hours from backup power (and provisions for switches that have battery, battery and generator, or just generator, though I can't fathom a generator backup only system intelligently operating itself in true emergency situations). It would definitely expose the true ability of the system to work under adverse circumstances.

Any discussion from anyone (not insults, please)?

David

2834. Question. Anyone recommend a surce for radio modem in UK with 10 mile range @ >9600 bps and TCP/IP

>
> But then a little bird told me there is a quasi-legal fix; a way to
> program the thing to transmit above 148 MHz. Does anybody know how I
> can do this?

There is nothing "quasi-legal" about this. It is 100% illegal. Here
are
a few of the federal regulations you will be breaking:

1. You cannot use a modified 2 meter HT to transmit beyond 144-148 MHz.
As soon as you push the transmit button you are breaking the law.
Ham
HT's are only type accepted for 144-148 MHz transmissions, and then
under the control of a licensed ham radio operator.

====Well, not necessarily. Authorized MARS/CAP mods out of band are
quite legal. It's very possible that Mr. Amend is a licensed amateur

2. Your hobby club cannot legally transmit on 151-152 MHz under any
circumstances whatsoever. These are public safety service
frequencies.

====Nope....as part of the "re-farming" recently, the FCC basically
eliminated the various services as we have know them, and now all (well,
almost all) freqencies are pooled. The old Public Safety Service,
Forestry Service, Fire Service, etc. are no more. The various
coordinators are required to notify each other on a daily basis to avoid
duplication. Also, under the old plan, there were many other services
allowed in that segment. It was not exlusive to public safety.

3. Persons who are authorized to transmit on public service frequencies
still must use radios that are "type accepted" to transmit on
those frequencies. This does not include modified ham radio HT's of
any variety.

4. It is illegal to transmit from any aircraft in flight (including
gliders)

except on the aircraft band frequencies. These are all AM not FM,
and
are in the 121 MHz range for gliders. To transmit on the approved
air band frequencies, you also need a license. The only FM
transmissions
allowed are for search and rescue and the like.

====Beg to differ with you here, again. Transmissions from any aircraft in flight are most definitely allowed under a variety of circumstances. While there may not be a specfic exception applicable to this gentleman, consider air ambulance operations that communicate with hospitals and publci safety agencies on VHF, UHF, and 800 trunked frequencies. Don't forget news and traffic reporters that use same frequencies, and/or higher for video feeds to studio.

Hope this helps Mr. Amend. While what he is proposing may be illegal, I think that it's only fair to provide accurate information to him. :)

Allen

That is true but the key word here is AUTHORIZED.

The only reason MARS & CAP members can modify radios is that these frequencies
are government frequencies which are administered by the NTIA, not the FCC.
They are transmitting on military frequencies as members of organizations
that are part of the government. Only CAP members and MARS members are
authorized to modify & use ham radios outside the ham frequencies. MARS &
CAP may transmit ONLY in parts of the 138-144 MHz band. These are stricly
military frequencies with no approved use by the public.

The special exception given to MARS/CAP members to use modified ham radios
ONLY applies when they are transmitting on the MARS/CAP frequencies on
official business of MARS or CAP. So we are talking about a very narrowly
defined exception stated in the federal regulations.

On the other hand, this guy is planning to apply the "MARS/CAP mod" to
support his hobby club that transmits on some business band channels in
151 MHz. I stand by my statement that it is 100% illegal for him to do this.

The way I see it, is that Brabham must actually think that I care what
he thinks about me, like he thinks I am here on a popularity mission,
and he extends this thought to other amateur TCPIP'ers as well. I
believe this is called insecurity.

Wake up, Brabham! I'm here to both gain and distribute information, and
to discuss topics related to amateur radio. I couldn't give a
flying-flip over how you want me portrayed, and I doubt seriously
whether anyone else is interested in your feelings for me, either. The
only thing people here should be concerned with is the information I
exchange (whether it is valid or not, not the motives behind it). Beyond
that, its just petty insecurity on your part. So, I sincerely ask that
since I don't care, that you give up and contribute meaningful
information, or quit wasting bandwidth.

I work around enough insecure people who believe in political infighting
to protect their own precious motives. I don't need to get it from my
hobby, too. Its not like I am out for the devestation of the hobby,
because, yes, revelation, I myself like amateur radio, too.

You are prohibited from using cellular phone while airborne. That's because you
hit too many cells and disrupt the network.

Ham HTs aren't Type Accepted *at all*. You can use one outside 2m, however,
if you have MARS or CAP authorization, because that operation is on military
frequencies where Type Acceptance isn't required. It *is* illegal to use a
non-Type Accepted radio on the frequencies of a radio service where Type
Acceptance is required, however.

>2. Your hobby club cannot legally transmit on 151-152 MHz under any
> circumstances whatsoever. These are public safety service frequencies.

Not exclusively. 151.625 MHz happens to be a USA wide itenerant frequency.
The Jobcom, etc HTs operating on the "Red Dot, Green Dot, etc" frequencies
fall in this range. These radios *are* Type Accepted, however, and operation
requires an itenerant license.

>3. Persons who are authorized to transmit on public service frequencies

Yes, this is true.

This is false. Aeronautical mobile operation is allowed for most radio services (except cellular). Type Acceptance is required for the radios operated in services other than amateur or military of course. The FAA may impose further requirements for radio equipment permanently mounted in an aircraft, or used on a commercial carrier.

I would think that a switch should be allowed in this "instant up" network as long as it was not in or did not use any permanent facilities.

What I think of for Field Day is when an area gets wiped out, say by being flooded, hams need to be able to establish means of communications, both locally and out of the area. So any network should have to totally portable, not use any permanent facilities and be off-grid. The NTS, while it is very slow, does meet those requirements. If packet can meet these requirements, I think it should be included not only in the Field Day contest, but also in all ARES and RACES emergency plans.

We've had a couple of emergencies here in Colorado Springs this year. Different command locations passing traffic all by VOICE. It amazes me how reluctant these people are on using packet for communications to non-mobile sites. They rather sit there and spell phonetically names and addresses. But I digress...

Gordon,

How could you say such things about Timewave !!!!!!!!!!!!!
According to some (US) defenders of this company, this is one of the better
companies.

But the fact is that there are a lot of rumours about getting money back,
but no one
knows anything about it.
I have also asked around here in Europe, but the retailers don't know
anything.
Timewave erased the DSP-232 from its web-site and doesn't react on E-mail.

So would you buy an DSP - 2232zx ????????? , maybe it got some bugs too
!!!!.
And now you know where you can go with your complaints.....
Yes correct to your deaf neighbour ....
But who cares, it was only a few hundred pounds, and here in the UK the
money
for modems grows on trees....

Awright, awright. I checked around. Our club (which is not an official club and will remain anonymous) uses these frequencies with the "tacit" approval (i.e. nobody's making a big deal out of it) of local authorities because we need to be able to communicate with air & land ambulances in case a pilot goes down in a heavily wooded and/or remote area. Paragliders are not airplanes- we don't carry ELT's. It is not feasible for every para and hang-glider pilot to get a license just so they can call for help. The least expensive, most reasonable safety-minded solution is to buy 2m handhelds and attack them with wirecutters.

You know Charles, I've seen a number of postings on this issue from a lot of people, and by far you seem to be the greatest offendor in the way of demonstrating ignorance and intolerance. You have some deeply personal axe to grind against those who have a different interest in amateur radio than yourself, and it shows itself time and time again in vitriolic posts against other amateurs.

>The very fact that field day is a vital part of Amateur Radio is all David
>has to know in order for him to start talking trash about it. - It's all
>part of being a "LandLine Lid".

He has noted that while the reported purpose of field day is emergency preparedness, it is in fact, run as a contest, with very little often being done to actually ensure emergency preparedness. In that regard, he is correct, and there can be little disputing. It is a good excuse to get out in the field and operate, which I think is a perfectly reasonable thing to encourage people to do, but to claim that it is for emergency preparedness is just silly.

As for your continual diatribes against TCP/IP, you may not believe that interoperability with data networks at large is a good thing. Heck, I question the utility and appropriateness of phone patches myself. But then, I don't spend a great deal of vitriol running down people that do use them either.

If you think you have nothing to learn from the networking world which is completely dominated by TCP/IP, then in fact, you will learn little. Frankly, I am not overly impressed by the packet network, which has data rates and reliability which can at best be considered "quaint".

>David is well indoctrinated with all of the moronic little LandLine Lid

Who's the jerk here? I didn't see ANYTHING about TCPIP, or land lines in this
entire thread (until YOU brought it up). The entire conversation was about
PACKET RADIO.

Charles, you've let your crusade blind you.

> wa7hra
> Hoodsport, wa

Hi Bob,
Regarding the "factory fix" - If you look at it closely you will notice it affects the TCM3105 modem-chip bit-rate selection, nothing to do with the audio path! I will try it though, just in case....keep watching...

Responses so far have been very welcome, but have not pin-pointed the problem. Suggestions have been:-

1) Jumper setting for Hi/Lo Impedance input. (JPRA)
2) Pot adjust to set "DCD" LED sensitivity.
(To which I would add Receive Bias adjustment pot...)
(Adjust for 3.3V on pin 10 (CDT) and 2.7V on pin 7 (RXB))
3) RTFM
(To which I would add "RTFDS" or "Read The Data Sheet" for the TCM3105.)

I've already done 1), 2), and 3), which only leaves the "factory fix", or a genuine fault, I think.

Drop me a line in a few days time, and I'll let you know what I find..

Hi All

I have recently acquired an ancient Yaesu FT2700RH Dual Band 2m and 70 cm radio, which I would like to use for 9K6 Packet on TCP/IP using a G3RUH type modem TNC (but only on a temporary basis - I want to retain full audio functionality of the rig)

Does anyone have a modification sheet that shows where the necessary audio input and output taps should be placed, and a list of components/circuit diagram showing the modification? Any costs involved will naturally be reimbursed.

Thanks in Anticipation

Nigel Kendal-Ward

> program the thing to transmit above 148 MHz. Does anybody know how I
> can do this?

There is nothing "quasi-legal" about this. It is 100% illegal. Here are
a few of the federal regulations you will be breaking:

1. You cannot use a modified 2 meter HT to transmit beyond 144-148 MHz.
As soon as you push the transmit button you are breaking the law. Ham
HT's are only type accepted for 144-148 MHz transmissions, and then
under the control of a licensed ham radio operator.

2. Your hobby club cannot legally transmit on 151-152 MHz under any
circumstances whatsoever. These are public safety service frequencies.

3. Persons who are authorized to transmit on public service frequencies
still must use radios that are "type accepted" to transmit on
those frequencies. This does not include modified ham radio HT's of
any variety.

4. It is illegal to transmit from any aircraft in flight (including gliders)
except on the aircraft band frequencies. These are all AM not FM, and
are in the 121 MHz range for gliders. To transmit on the approved
air band frequencies, you also need a license. The only FM transmissions
allowed are for search and rescue and the like.

Nope, I mean decode any packets. My experience of DCD on modems makes me consider them as nothing more than christmas tree lights. If it was called "Any Signal Above A Given Threshold Detect", it would be more appropriate!

BUT - I have since studied the Data Sheet a bit closer, and it seems that if the CDT (Carrier Detect Threshold) output is low (=DCD off), then RXD is clamped high, hence if the christmas tree light isn't on, the TNC will appear deaf, even if the audio level is high enough. Shame this isn't the cure for my problem, though!!! :-(

Thanks for all the replies,

>There is nothing "quasi-legal" about this. It is 100% illegal. Here are
>a few of the federal regulations you will be breaking:

NOT true. It is perfectly legal to modify your radio if you are a member
of MARS., or a member of CAP, for instance.

>1. You cannot use a modified 2 meter HT to transmit beyond 144-148 MHz.
> As soon as you push the transmit button you are breaking the law. Ham

NOT true. It's perfectly legal to transmit on any authorized frequency
from private aircraft. In addition to MARS and CAP member, I site members of
the press, members of local law enforcement agencies, and government aircraft
such as fire fighting aircraft, all of which transmit on various FM
frequencies in the land mobile spectrum, not to mention, cellular telephone
traffic.

>not RADIO is just like saying a ham from another country is not a ham
>just because he or she speaks a different language. Maybe you should
>know what you're talking about before you start whining.

I know exactly what I'm talking about, OM. No whine - Just fact.

Sure, there is a minority within the amateur tcpip community which actually
use radios. (yawn)

When you talk to anybody more than a few miles away via amateur tcpip,
you'll be on the telephone though, whether you like to admit it or not.
That's because there is no amateur RADIO tcpip network worthy of the name.

I suppose you can think of a bunch of piddly little ingrown tcpip LANs,
linked together by telephone as a "network", if you push the definition far
enough, but under no circumstances can such a mess be confused with an
Amateur Packet Radio Network - Because it just plain isn't.

If you want to participate in the real Amateur Packet Radio networking,
amateur tcpip will put you at a severe disadvantage, not to mention the slur
on your character. Try XNet or FlexNet if you are interested in Amateur
Packet Radio.

You see, Hams are much more interested in the real thing than they are in
"simulated packet radio networking" over the telephone. The real stuff is a
lot more challeging, and a lot more fun. Only the punks and geeks are
satisfied to "pretend".

Maybe you should know what you're talking about before you start whining.
Try it, next time.

> But I digress...

A mobile array would take some convincing, but I don't see why it couldn't be done. Of course for application to Field Day, to prove its abilities, we require the ARRL's backing to achieve some kind of conscensus of how scoring for quick-up switches factor into points, etc. Perhaps points for each message forwarded through a node? I guess each station on each end of the link will have to record the final node contacted and each node in between, so that the nodes in between can recieve credit. It shouldn't be too hard. The hard part, again, is ARRL support. Who do you contact?

Believe it or not, 1200 baud equipment would probably be best for emergency coms until high speed systems come up to the same level of reliability as is found in 1200 baud systems, in that 1200 baud systems are basically immune to multipath, so you could just pick a good midpoint and park, setup, and announce your presence.

Not at all. I'm very easy to get along with, as long as you are not "part of the problem" which has been dragging Amateur Radio in the US down. David and his LandLine Lid buddies are definitely part of that problem.
You can sit back and watch morons like David run down the hobby if you like. - And it appears that you do. Sicko.

>You have some deeply personal axe
>to grind against those who have a different interest in amateur radio than
>yourself, and it shows itself time and time again in vitriolic posts
against
>other amateurs.

Nope. I don't have any personal feelings regarding the Lids on this reflector. I don't have any personal grudge against a snake on the road when I back my car up one more time to be sure, either.
What I'm saying has nothing to do with personalities, and a lot to do with "pest control".

I'm not insulting anyone when I mention that the behaviour of David and his LandLine Lid buddies is moronic, or that he in particular is a jerk. No insult is intended; I'm just trying to be accurate.

I call them as I see them. If you don't like it, you'll have to find yourself a place in line with all of the other whiners who can kiss my hairy old butt. - The end of the line, please. No cutting.

Maybe to another LandLine Lid.

Hams know better. Most hams, in fact, are intelligent enough to figure out
WHY field day is set up as it is, and do what they can to make things better
every year.

Worthless bozos of Davids ilk would rather just piss all over field day,
rather than admit that they cannot comprehend how it works.

David's whines about packet and field day are particularly stupid, by the
way. Any excuse for negativity is good enough for some scum, I suppose.

>It is a good excuse to get out
>in the field and operate, which I think is a perfectly reasonable thing to
>encourage people to do, but to claim that it is for emergency preparedness
>is just silly.

To claim that you know what you are talking about would be even sillier. I
doubt very seriously that YOU could come up with anything even one fourth as
efficient and useful as the present field day setup, if you dedicated the
rest of your miserable existence to it.

Go ahead - Prove me wrong if you can. Surprise me.

You're just another blob of the scum which is presently trying to run down
Amateur Radio in the US, as far as I'm concerned. I've scraped better off of
my shoe on several occasions.

>As for your continual diatribes against TCP/IP, you may not believe
>that interoperability with data networks at large is a good thing.

Nope, I think it's just fine.

>Heck, I question the utility and appropriateness of phone patches
>myself. But then, I don't spend a great deal of vitriol running down
>people that do use them either.

Neither do I. I point out moronic behaviour by anti-ham bozos like David
and yourself though.

>If you think you have nothing to learn from the networking world which is
>completely dominated by TCP/IP, then in fact, you will learn little.

I've learned that tcpip is no good as an Amateur Packet Radio networking
protocol. You disagree? Well, show us an international, or even a national
TCPIP RADIO network. (You can't, because none exist.) Get it?

Build a real RF network using IP, and I'll be glad to see it. Surprise me.

>Frankly, I am not overly impressed by the packet network, which has data
>rates and reliability which can at best be considered "quaint".

Even less impressive are morons who use telephone connections and "pretend"
that what they are doing is "Amateur Radio". Sorry, but a genuine packet
radio network (at any speed) is much more impressive than a "pretend" radio
network (at any speed).

"Hams" who go out of their way to defend the actions of scum such as David
are no better themselves.

Want to do something for Amateur Radio? Take a long walk off of a short
pier.

Want to lose ten pounds of ugly, useless fat? Cut off your head.

;-)

2868. Lids in Texas destroy TexNet.

TPRS, (Texas Packet Radio Society) has recently come out of the closet as a Non-Ham organization. According to the TexNet network manager, N0CCW, only the name has anything to do with Amateur Packet Radio. TPRS is not, in fact, an Amateur Radio organization no matter what it's name may imply.

It's ironic but true that if you want to support Amateur Packet Radio in Texas, The "Texas Packet Radio Society" is the very last place you should consider sending your money. They are not interested in building an Amateur Packet Radio network at all.

Take a look at the May '98 issue of TPRS's "Q-Report" to see what I mean.. No mention of packet radio, except how it's somehow just not good enough.. The bulk of the newsletter is dedicated to the "great challenge" of abandoning Amateur Radio so that all of TexNet's nodes can be linked to each other by the Internet instead. - Along with an implication that in the near future, TexNet nodes without good *Internet* connections will be phased out of the network altogether. I know that many of the TexNet node-ops are real Hams, and these appear to be the ones TPRS intends to edge out.

What kind of an organization would deliberately plan on edging out Hams using
Radios in favor of "digital communications hobbyists" using The Internet, or "wirelines" donated for the purpose by commercial communications outfits? Why TPRS, of course. - The worst enemy of Amateur Packet Radio in Texas, and the best friend of the commercial communications outfits who would love to grab up our spectrum.

When irresponsible "digital communications hobbyists" go out of their way to undercut our use of Amateur Radio as Hams, imposing instead an unseemly dependence upon Non-Ham means of communication, they leave all Hams wide open to attack by commercial communications outfits who covet our bit of spectrum. " Why do Hams need (Insert Band here) if they prefer to use the Internet anyway? " -- A very good question!

Why, I wonder, is the "Texas Packet Radio Society" so cozy with commercial communications outfits, constantly pushing Non-Ham means of communication while distancing themselves further and even further from Amateur Radio and their fellow Hams?

That's not the kind of people I would care to be associated with. I'd rather work with Hams. - Real Hams who want to see Amateur Packet Radio advance and grow.
A few members of the isolated, insulated little clique that has controlled TPRS since it started are of a mighty high opinion of themselves.. They appear to believe that if THEY cannot figure out how to surmount a problem,

then of course nobody else ever will or could either, and that the best policy for all Hams is to "be realistic" and give up on Amateur Radio right now, in an organized fashion.

In fact, most of the innovation and industry recently associated with the Texas Packet Radio Society appears to have been in that very direction; Leading Hams to abandon Amateur Packet Radio networking in favor of Non-Ham means of communication.
N0CCW was giving us the straight scoop when he said that TPRS is not an Amateur Packet Radio organization. It appears to be the exact opposite.

This is why roughly half (over 1000 miles) of the current Texas TexNet "Packet Radio Network" is actually donated wireline links. They claim to be the biggest Amateur Packet Radio network... Well, remove the 1000 miles+ of Non-Ham links and all of a sudden they are running a distant fourth place. Still impressive, but not for long if TPRS's newsletter can be believed. They appear to be ready to deliberately phase out the use of Amateur Packet Radio soon, so that TexNet will no longer be an Amateur Packet Radio network at all. -- And they look forward to that as "progress" ?? ! ??

I guess it may be "progress" for the isolated/insulated TPRS clique, but it sure isn't good news for Hams, whether they live in Texas or not.

When "Digital Communications Hobbyists" (Packet Hackers) route Amateur Packet Radio network traffic over the Internet, they directly undercut the essential reason for allowing Amateur Radio operators the stewardship of our bit of spectrum in the first place.
They cut the throats of all of their fellow hams in the eyes of Congress.

Additionally, simulated "packet radio networking" using Non-Ham means of communication only serves to displace and replace genuine Amateur Radio networking efforts. - It edges out the Hams.
The president of TPRS, Tom McDermott N5EG, does not appear to be content with the speed at which Hams are being edged out of the packet net in the U.S., and is doing what he can to accelerate the process.
What a guy.

When the Hams in Texas decide they would like to initiate a new, REAL "Texas Packet Radio Society", which clearly states in it's charter that the organization is dedicated solely to advancing Amateur Packet Radio, I will be glad to participate.

TPRS's charter does not call for dedication to Amateur Packet Radio. It is a "digital communications hobbyist" organization instead, which explains why TPRS has had no problem in turning against Texas hams, working to destroy
Amateur Packet Radio networking in Texas, and replace it with an utter dependence upon Non-Ham means of communication. (Internet, Wirelines, ect..)

I have too much personal pride as a ham to associate myself with a Non-Ham organization like TPRS, or the "Non-Hams" who run it. When I want to use the Internet, I dial up my ISP. When I want to utilize Amateur Packet Radio, I use radios. I will not associate myself with persons who cannot comprehend

that simple distinction, and who show no respect for Amateur Radio and their fellow hams.

I am a Ham Radio Operator, and not a "digital communications hobbyist", so it
would be a waste of my time (not to mention the slur on my character)
if I were to participate in the activities of TPRS.

If "digital communications hobbyists" are starting to take over YOUR Amateur Packet Radio organization, take a hint from the state of Texas, and weed them out right now. You'll be glad you did, and you'll be sorry if you don't.

Thanks for taking the time to look and think this over.

Can some one help me find answers to following queries.

How to select type of radio communication equipment ?. For what application SSB(HF) / VHF / UHF transceiver is used ?

How to select a antenna ?

Regards,

Shiv Prakash Khemka

The above clip is what has done the most damage to US Amateur Packet
Radio Charlie.

Attitudes like "You do it MY WAY or hit the highway!" have been the
most destructive of all.. That is the main reason why so many US hams
went the way of the internet because it is so very easy to get around
the very obstacles that were holding packet back: lockouts, lid lists,
and the ever famous Block His traffic.SYS because I don't like what he
is saying or trying to do.

You Must be Crazy as a loon!! Just think of all the new voice
repeaters that can go up with the extra space after packet is
just a "dusty TNC on the shelf"

:>Additionally, simulated "packet radio networking" using
:>Non-Ham means of communication only serves to displace
:>and replace genuine Amateur Radio networking efforts.
:> - It edges out the Hams.

On the contrary, like I said, more hams will be using the
extra space for voice. Face it Charlie, store and forward
on packet is just not up to speed anymore. If you want to
see a successful use of packet, just look at the DX Clusters.
Doesn't matter if you are hooked in by wire or RF, everybody
gets the data quickly and that is what its all about. What good
would it be if some jackass decided to turn the node off
because enemy #1 happens to be on it.

:>When the Hams in Texas decide they would like to initiate a

:>in it's charter that the organization is dedicated solely to advancing
:> Amateur Packet Radio, I will be glad to participate.

I don't see why, you turned your nose up at them before in the
past when such was the case.

:>am a Ham Radio Operator, and not a "digital communications hobbyist",
:>so it would be a waste of my time (not to mention the slur on my character)
:>if I were to participate in the activities of TPRS.

What's really a shame is that your ranting and raving has done just as
much damage as anything else and you just don't realize it. Arguing,
flames, bashing, name calling and the whole nine yards is as good
a reason as any to go to TCP/IP and "By Pass" that CRAP!!!

Oh yes Charlie, I've seen enough of the above behavior from you on
the packet network to know that a "slur on your character" has never
stopped you before. """We have found the enemy, and it is us."""
"""Kill the enemy"""

LVP5N "how backwards of me"

I see where a coward decided he was "big enough" to flame but not "big enough" to admit his name and (if any) callsign, and has gone so far as to obscure his E-mail address.

About what one can expect from a LandLine Lid.

I don't debate with cowards.
